The big, big, computer show moves North!

Greater Manchester Exhibition and Event Centre

The 8th official

**AMSTRAD
COMPUTER
SHOW**

Organised by
Dobson Exhibitions

10am-6pm Friday October 23
10am-6pm Saturday October 24
10am-6pm Sunday October 25

G-Mex Centre, Manchester

The fastest growing computer show of them all is now moving North – to the most innovative, prestigious exhibition centre in Britain.

This magnificent building will play host to all the major companies in the Amstrad market – including Amstrad themselves, showing the complete range of machines.

Whether you own an Amstrad CPC, PCW or PC – or just thinking of buying one – there will be lots for you to see and enjoy

FREE presentations in the Amstrad Theatre.

We've set aside a huge area to meet the heavy demand for seats during the non-stop presentations. You'll see demonstrations of new products, hear about all the latest developments, and be able to grill the experts.

How to get there

Situated in the heart of the city centre, G-MEX is only one mile from the M602, and there's ample parking space beneath the hall. Within easy reach of Victoria and Piccadilly railway stations.

New games galore for the CPC

AS the countdown to Christmas speeds up, a wester of new games for the Amstrad CPC has come pouring from the software houses.

The festive season floodgates are once again about to open after an abnormally busy summer for software sellers.

And the CPC's versatility and superb game playing capabilities are shown in the vast variety of products on offer.

One house alone - Gremlin - has seven new games on the starting blocks.

Others, like Martech and Activision are boasting latest licensing deals, and newly-written work is being presented by Incentive, Digital Integration, CBI, and Electronic Arts.

All of which goes to show the continued popularity of the CPC in this highly competitive market.

A NUMBER of popular cartoon and real-life characters feature in the offerings from Gremlin (0742 750420). World Cup hero Gary Lineker has put his name to Superstar Soccer, claimed to be "a completely innovative and original genre of a football game".

From the television cartoon, Mask II features the hero Matt Tracker and has two main elements: The selection of team and vehicles and the completion of four missions.

Also from the small screen, another youngsters' favourite, Masters of the Universe, has been topped to produce The Feature Movie as He-Man takes on Skeleor.

Disney hero

Best The Great Mouse Detective comes from the big screen and is the latest Disney hero. From his study at 221B Baker Street, he sets out to find his faithful companion Dr Dawson in elementary fashion.

Blood Valley is a Gremlin fantasy adventure based on the Dunsinane series of fighting books,

while Alternative Games is a simulation including such nailing, log flopping, running up walls and boot throwing.

Compendium is described as a whimsy adaptation of a series of traditional board games.

Slain, the 2000 AD cult hero has been licensed by Martech (0223 388456) and turned into a game of the same name featuring Pallas - said to be a totally different type of control.

The player is required to take over Slaine's mind so that as each situation arises, the brain needs to make sense of what is before it.

Interactive 3D graphics

Driller from Incentive Software (07356 77388) features FreeSpace, a 3D environment simulator. Looking in any direction will produce a view in solid interactive 3D graphics.

The latest adventure from CBI, (01-633 2918) - Book of the Dead - is the first from a young group of programmers called Essential Myth.

The hero is an Egyptian godling called Raah whose father's attack on the gods leaves him banished from the heavens.

Fantasy adventure - The Bard's Tale - is among the pre-Christmas offerings from Electronic Arts (0753 88442).

Spreading evil

The action takes place in the sandy town of Skara Brae where a small group of unproven warriors must

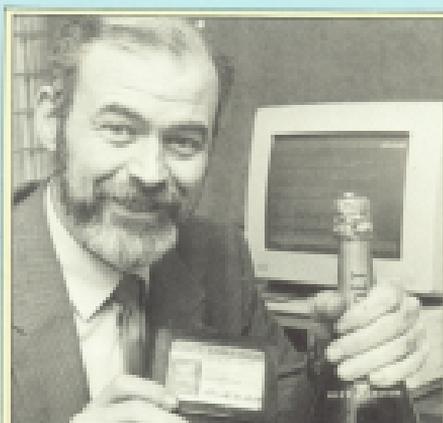

fight to stop the spread of evil from the wizard Manger.

Articlon is an Electronic Arts combat simulation based on a super-tank designed for polar combat.

A head-up display mimics control movements on screen. The view from the tank reveals targetable alien resources and the hostile polar terrain.

The software house is releasing another combat simulation, PHM Pegasus. Here a hydrofoil missile craft travels the oceans battling with numerous enemy vessels in any of eight different combat assignments.

CHAMPAGNE HANGOVER

A NATIONWIDE electronic mail competition offering a cupskin of champagne as the star prize resulted in a giant hangover when the winner unwittingly caused the software in the central computer to crash.

When ex-San Francisco police officer Cameron (Cam) Lacey posted the 10,000th message on the Mirrorlink bulletin board from his office in Grimsby via his CPC8128, all that should have happened was that he received a three line bottle of M&D Chandon to mark the milestone achievement.

Unfortunately what no one realised at that time was that the BBS system was only designed to cope with a date field of four characters - up to and including 3,999.

So when just one additional message was received, it was as if a giant fuse had blown.

When the crash came there was consternation at Mirrorlink headquarters. What made matters worse was that technical chief Tim Clarkson was on holiday and all attempts by his

staff to revive Britain's biggest bulletin board were unsuccessful.

After two hours of frantic transatlantic telephone calls, the American authors of the bulletin board software finally found the problem.

They were, however, unable to make the message numbering system accept a figure larger than 3,999. All they could do was make room by deleting the first 3,000 messages.

In fact, the only person left with a grin on his face was Cameron Lacey.

According to Mirrorlink boss David Meakin, it should have been a sheepish one. For it seems that Cam cheated a little bit.

"He'd obviously written a program that started sending identical messages just as the number of messages on the board was approaching the 10,000 mark".

All the messages said was: "Is this the one?"

"So he ended up with the drink while we got left with the hangover".

BrunWord update

BRUNING Software has produced an upgraded version of its word processor, BrunWord, for the CPC8128. It features a screen update more than

twice as fast as its predecessor.

Bruning (0245 252664) say that other additions include ten special user defined characters and the fact that words and phrases can now be replaced.

BrunWord 8128 costs £28, complete with BrunSpell and DataFile. Back-up copies cost £7.98.

Crammed chat

A PROGRAM which can compress English text by as much as 50 per cent is being marketed by Ballinderry Software of Northern Ireland.

Targa is supplied on a 27128 again and its 38 plus RSX commands are installed when the machine is booted. Two commands are concerned with text compression, the first enables the user to store and manipulate text data in a ram file.

Tom Kirk of Ballinderry (0644 49220) said: "Text

compression is something which has intrigued me for many years.

"When the cost of spools fell significantly a couple of years ago I decided to begin work on such a program for the CPC.

"I think this is an ideal spool program since it allows more text to be held in ram without using up appreciable memory.

"I have achieved my aim of an average 50 per cent compression of English text", he said.

Show goes North

NEW attractions have been organised for the Amstrad Computer Show in Manchester.

For the first time outside London the show will include the Amstrad Theatre - seven full non-stop presentations of all that's new for the CPC and its sister machines.

The large theatre area includes seating enabling 100 to watch and listen in comfort while experts demonstrate the latest hardware and software and conduct question-and-answer sessions.

In addition, there will be no fewer than eight huge feature stands occupied by major suppliers, Amstrad itself and the Official Amstrad Users Club.

These impressive feature areas - contributing to a total of 39 individual exhibitors - are made possible by the show's location at St-Max in central Manchester.

The 180,000 sq ft Greater Manchester Exhibition Centre was specially chosen to house the UK's biggest computer specific show ever held outside London. It runs from Friday to Sunday, October 23 to 25.

Among the many suppliers working on new CPC developments for release at the show is Sines Software.

The firm is launching an spool programmer for the CPC range, price £49.95, and will also have a disc-based CPC word system called UltraSound on offer for £12.99.

Money-saving advance ticket details are given on Page 4.

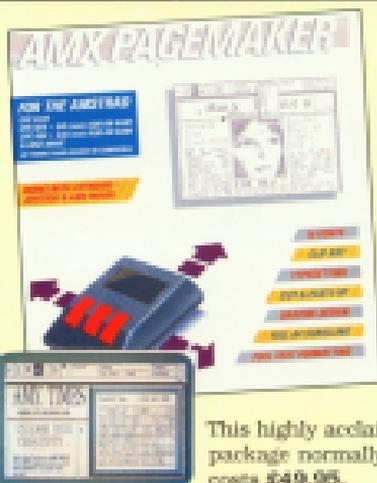

STOP PRESS!

Desktop Publishing comes to the Amstrad CPC

Now you can design your own magazine or newsletter - using either keyboard, joystick or mouse.

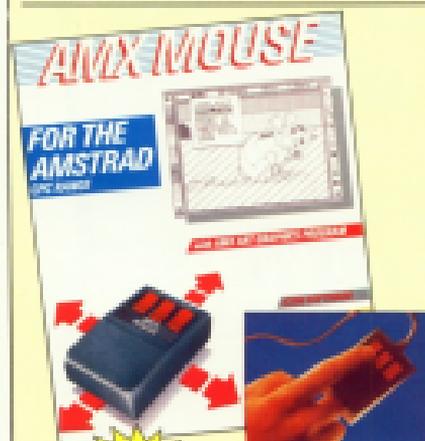

AMX Pagemaker is overflowing with features:

- 16 typefaces in a range of sizes - or you can design your own
- Flow text round your artwork
- Crop graphics images - or stretch them to fit
- Built-in painting and spraying facilities
- Zoom option for detailed editing
- ... and much more!

This highly acclaimed package normally costs **£49.95**.

For a limited period you pay only **£39.95** - a saving of **£10!**

**SAVE
£10**

Normal price
£69.95

Special offer price **£59.95**

Bring the power of the mouse to your CPC

This is what reviewer Gabriel Jacobs said in the June 1988 issue of Computing with the Amstrad:

"The bundled software is magnificent. I can't think of another add-on in the same price range which will give you as much enjoyment combined with as much practical potential."

... and it's the perfect complement to AMX Pagemaker

Here's what you get:

- Top quality mouse with solid rubber ball-bearing
- Interface to connect the mouse to your CPC
- AMX Art, AMX Control, Ico-Designer and Pattern Designer software included - on both cassette and disc
- Comprehensive user manual

JOE BLADE

Players
£1.99 tape,
joystick or
keys

So the world leaders have been kidnapped by a vicious gang of terrorists led by Crax Blood-finger, playboy, war, politician and international villain. The billion dollars is the primary sum required to secure their release and of course the governments concerned have refused to pay up.

That's where you come in, surprise, surprise. As Joe Blade you must penetrate Blood-finger's fortress, rescue the leaders, activate six time bombs and evacuate before they detonate.

The fortress is displayed as a 2D side-on view spreading over 127 screens. Joe Blade is a Spectrum conversion and it shows. The graphics are detailed, backgrounds and scenery well done, but are in Mode 1 and unimpressive in their use of colour.

Scrutinising the packaging supplied with this reproduction copy I couldn't see any difference between the Spectrum screen shots and what was on my Amstrad's monitor - a pity.

In the old low common denominator syndrome that CPCs have always suffered from and I'd hazard a guess that those who see the original Spectrum graphics after being run through a conversion utility.

Amstrad enough whinging, how does it play? Fairly well if you can still find interest in an average, tranda-voiced theme and collect the objects to be seen.

The fortress is crawling with Blood-finger's private militia,

purvating guards and knife-wielding henchmen intent on bringing an ear-to-ear smile to your face.

Contact with any of these drains your energy unless you find an energy source. This provides a temporary disguise which lets you slip past the huge unrelenting.

You're equipped with a machine gun which will decimate the opposition, but you need to find ammo dumps regularly.

Unless I missed something, the only other hazard to contend with is the bombs. Walk over one and you're faced with a little escaping game to leave the activation code. Fail to find it in the time limit and it's curtains as the booty trap traps.

As a cheapie it's good value for money and fairly entertaining, just a bit lacking in pace.

Ian Sharpe

Presentation 50%

Few options.

Graphics 50%

Detailed, sometimes with, but flat.

Sound ??

The production version will have some, this copy didn't.

Playability 80%

Challenging enough.

Additive qualities 65%

Can get a grip if you haven't played many of this type before.

Value for money 70%

OK as a budget title.

Overall 55%

With more effort could have been a lot better.

SLAP FIGHT

Ocean/
Imagine,
£8.95 cass,
£14.95 disc,
joystick or
keys

YOU are the pilot of a Slap-fighter and must destroy the evil alien warriors which confront you - wave after deadly wave on the ever hostile planet of Crad. Heard this somewhere before?

The game was converted

you may as well give up there and then 'cause you're not going to get much further.

Very high frustration factor this one, and it will do a lot for the sale of blood-pressure tablets. I must learn not to take so many chances - it's probably my suicidal tendencies rising to the surface.

Whatever strategy you adopt, you're got to learn the alien's formations and fire patterns if you are to stand any chance of completing the game.

Yup! Life can get hectic out there on the planet Crad, so much so that I pulled my stick

from Tahr's con-up. The left half of the screen shows nothing (or at least very little), while you battle it out on the right.

The general play is to shoot everything in sight. Some aliens drop a star when hit and if you catch one - by flying over it - a pointer on the left of the screen comes down a list of facilities you can add to your Slapfighter. These include increase speed, revert to original fire power status, add wings and increase fire power, throw bombs, laser fire, homing missiles and temporary shield.

The Slap Fight first two September Amrtdag seems a reasonable strategy. It basically hinges on getting the homing missiles and increasing your firepower as quickly as you can.

Even then, the homing missiles don't automatically hit everything you think they should.

The aliens come at you fast and furious and the only way to play is to fly by the seat of your pants - and pray.

When you lose one of your five lives, all the accumulated goodies go with it. If this happens any way into the game

to anything-forever joystick mode (the console several times. Who says it's a bad loss?

Ian Whugh

Presentation 70%

Plays best with a joystick but definable keys, too.

Graphics 80%

Nice backgrounds.

Sound 80%

Nice tunes.

Playability 55%

You still have to waste through the first stages even after you've mastered them.

Additive qualities 85%

If you've a good memory for alien flight formations and the fire patterns that's 85%.

Value for money 70%

A fair game at a fair price.

Overall 75%

If you like ports fast and furious with a repeat (rate that a dollop of frustration you'll enjoy this.

Z

Rino

**£4.99 case
joystick only**

A PLACE in the unknown where the strand of death awaits in the land of the alien... That's the sum of the scenario and it's a touchingly simple introduction to a good old top.

A couple of years ago, just at the height of the shoot-'em-up-remake-type-of-games that reached its peak in *Ultimate 2*, was released by Atlagea on the Commodore.

Then it was a sports game on a very simple after theme. Now it is still sports, but just a little past its prime, hence the bargain price.

There are three screens. The first is an above the alien planet, and you can move your ship in eight directions, stepping all the way.

At first confusion reigns, as all sorts of sprites fall around the cluttered screen. There seems to be an awful lot of obstacles to bump into, and your energy is drained with each encounter.

But with a bit of practice, you'll be able to sort things out - manoeuvres and bullets zip around at random (I think), and there are good reasons to be had for knocking them off.

Meanwhile, a squadron of alien birds roams diagonally across the screen and if you can avoid their missiles, you can pick them off one by one.

Once you've polished off 10, a sort of flying energy capsule is created. Catch this, and you'll

be awarded with a bomb that you can lob towards the force field of the Hypercube Transport Line. Flying through the gap created will get you on to the next screen.

This is the countryside battle zone - more planets, and a different type of alien, and that on to the lunar landscape, with mother-ships and extra lives to be won.

The final encounter is right-fight, with all the aliens and the ultimate enemy - the alien control ship.

The action and mindless violence never let up. High scores are there for the taking, and it is this which will keep you coming back for more. At the asking price, *Z* is the A-Z of space sports.

Tom Bridge

Presentation 50%

The joystick only option is a reservation.

Graphics 70%

Colourful and smooth.

Sound 50%

Nothing special.

Playability 80%

OK for a quick blasting session.

Addictive qualities 80%

It's got a bit going for it.

Value for money 75%

Come on down the price is right.

Overall 75%

A good treat.

BLACK MAGIC

Datasoft

**£9.99 case,
£14.99 disc**
joystick or
keys

DERTHS the sunny hills, Marigold is not a happy place - well, how could it be, what with *Zahgan* the Qiro holding sway and going and doing all around the place.

Your master Anakar, the last good wizard left in Marigold, has recently had his life in the roaming demons, so it has finally come down to you to save Marigold.

The simple task ahead is to

sound and will offer you gifts of extra spells or arrows in exchange for valuable food. A few also walk around and they pick you up to drop you somewhere else.

This can be a boon if you're trapped by monsters, or a disaster if you're dropped from the flying pan into the fire.

The graphics aren't great by today's standards - there's more than the look of realism about some of the monsters, and sound is confined to spot effects only as you pick up objects and so on.

As the game relies on building an experience, it would be nice to have a save game feature.

track down the six magical eyes of Anakar scattered by the evil *Zahgan*. This isn't going to be easy of course, what with all the usual array of monsters inflicting the scorching landscape.

You start with nothing but the clothes you stand up in, but soon you'll come across chests of arrows, spells and stacks of food.

Your main adversaries at this point are the death-scoring plants - you can duck to avoid their fatal arrows, or shoot off a quick arrow or two to neutralise them, but there'll always be more.

As soon as you pluck one of Anakar's eyes (yesssss!), all the other army, slithering, gibbering monsters will rise from the ground and come after you.

As well as the arrows, you can use your spells to avoid the monsters. As you gain experience points, you progress through the levels of wizard and can enter a resurrection. At each stage more spells are available.

The occasional Trail leads

Despite all this, the gameplay is totally addictive and will have you coming back time and time again.

Tom Bridge

Presentation 60%

Good instructions. Colourful title screen. Let down by the lack of a save game feature.

Graphics 50%

Not brilliant.

Sound 45%

Negative - not worth the effort.

Playability 70%

Plenty to do.

Addictive qualities 90%

I couldn't leave it alone.

Value for money 40%

Overpriced.

Overall 70%

If this is your cup of tea, it's a fun game.

ROAD RUNNER

US Gold
£9.99 cass,
£14.99 disc,
joystick or
keys

BEEP, beep, beep! Road Runner has arrived from the arcade, fully pursued by Wile E. Coyote, eager for a driver's seat. This may be one of my all-time favourite cartoons, narrowly beaten by the original Tom and Jerry. Though not the greatest ever, the arcade game isn't bad either and it translated well to the Atari 520.

You have to pilot RR along a fairly direct road which scrolls past while Wile E. Coyote gives chase. Along the way are heaps of coins to be eaten for points and the occasional Bun or Beakall can turn your feathered friend into sandwich filling.

RR can withstand an unlimited coyote who soon disappears off the right side of the screen, only to come roaring back a few moments later on a jet-powered plate board. This makes life difficult to avoid as the boss of times and will fight impossible on the narrower sections.

On some screens RR's equipped with one of a rocket, prop stick, outguns and probably other things as well if you make it far enough. When RR gets caught Wile E. carts him back a way and a life is lost - a bit harsh, the programmers should have made a meal of this.

The Amstrad version looks similar to the others but only one layer scrolls and the playing area is a window set in a wide border. The graphics are

bright and cartoonish but there's a lack of attention to detail. For instance, on a screen where the two characters can get burnt, in the best traditions of the art they instantly turn black from head to toe. Great, but you get the same effect when they do anything else essential like stepping off the edge of a cliff.

After a couple of evenings spent playing it I got fed up. The infectious sense of fun in other versions seems to have gone rather flat. Perhaps it could have been more inspiring if they'd spent another month on it and hadn't tried to be so faithful to the original, with all the compromises that inevitably entails. As it is, it's before you buy.

Andy Jackson

Presentation 50%

No definite keys but you can start the game on the screen where you last died.

Sound 20%

Just a few beeps (E) in this preproduction version.

Reasonably close to the original, but could have been better.

Additive qualities 50%

None.

None.

Playability 50%

Not very in places but other parts seem designed to frustrate.

Value for money 40%

Lacks staying power.

Overall 55%

Not this month's best buy.

KILLER RING

**Reaktor/
 Ariolasoft**
£4.99 cass,
joystick or
keys

WHEN you're tired of playing serious games or working out complex riddles, or you've finished typing out your latest novel on your word processor, you sit back from the steaming keyboard and you start to dream of how nice it would be to go back to the

arcade in fourns and these must be eliminated too.

The object is to reach the spaceship, once he's eliminated its back to the start again - only faster of course.

There are two difficulty levels - under your control from the opening title screen. The easiest is a normal shoot 'em up, the hardest doubles a moving force field line that rotates from the top of the screen to the bottom throughout the game. You are unable to shoot through this so must move above or below it in order to hit the invaders.

simple straightforward games of yesterday.

That's what this latest release from Reaktor is. Remember Space Invaders or Galaxians? This is a close between the two and at the price it's not bad!

Your base is a kind of spaceship bubble, and the object is to shoot anything and everything. You can move over the whole of the lower two thirds of the screen and the laser beam when fired emits from the top and the bottom of your bubble.

So once the invaders have started to move around the screen it is possible to hit two at the same time, one above and one below. Naturally they don't all die, but they explode on you.

Opening screens start off easy of course and get progressively harder. You need quite a good aim to hit the invaders and on later screens when you must hit other bubble types, a direct hit at the centre is the only way to eliminate them.

Also on later screens, strange objects (which look like squashed mechanical) move

I found the game a bit slow and a little odd to reach the spaceship.

Paul Sheppard

Presentation 80%

Easy to use and understand.

Graphics 50%

Nothing special.

Sound 50%

Just spot effects or music (the choice is yours).

Playability 90%

Easy to play.

Additive qualities 55%

A good mixture of Space Invaders and Galaxian - although perhaps only for high score addicts.

Value for money 50%

For a range of cheap games for quarter - it could be cheaper.

Overall 63%

Not bad, but nothing to rave about.

MASK

Granlin Graphics £9.99 case, £14.99 disc, joystick or keys

Granlin's latest release you assume the role of Agent Tracker as he sets out a quest of justice at Boulder Hill. This is a tie-in with Kenner Parker Toys's Mask characters, of which I must confess complete ignorance.

The scene is set by a comic strip-formatting pair of the instructions. To cut a long story short, which has attacked Mask's base at Boulder Hill and after dropping a time bomb, a vortex has opened in the time-space continuum.

Mask agents and their assignments have been scattered throughout time and it's your job to find them and nullify them.

Part one takes place on Boulder Hill and it's thick with an unending supply of ammo and opportunity. You are in Thunderhawk, one of those Ferrari cars (at a great convenience).

The view is from an isometric and the driving window controls smoothly as you move. Thunderhawk can fire missiles and plant bombs which can be placed up at various points. Now pay attention man, because the next bit gets complicated.

On every screen, apart from the first where there is only one, two hidden agents must be rescued. The process for locating an agent goes like this:

Find the scanner and the two masks. Called the scanner keys, not all of which are useful but one key can be held at once. When you've found at least two try to assemble them into the letter S.

If they don't, drive round stopping keys for clues not collected until they do. When you've got an S the scanner will be activated and it will lead you to the agent. Got that?

As you scout round, the enemy will inflict damage on Thunderhawk. Too much and you're dead. Repair kits will patch up the damage but there is only a limited number.

Later parts, which I couldn't reach, are in the future, post-horror and at the Vulcan base which must ultimately be destroyed.

Overall, it was too much like hard work to be real fun. As I played the feeling was one of frustration - the level of difficulty varied too much from one game to the next.

If you buy this game you'll probably find it addictive enough to entertain for a week or two but wouldn't make it my first choice.

Ian Sharp

Presentation 90%

You have to physically disassemble cases and there's no refundable keys.

Graphics 75%

Bright and colourful with smooth scrolling.

Sound 50%

Skimpy.

Playability 80%

Tricky handling lets it down.

Additive qualities 70%

Yes, but they've done better.

Value for money 50%

Should have been £3 cheaper.

Overall 85%

Complicated, but doesn't stand out.

PAPERBOY

Elite £8.95 case, 14.95 disc, joystick or keys

BEHOLD the ready, it's time to start your new job as the local paperboy. This label offering from Elite is a cracking conversion of the arcade smash hit.

Your boss, a rather unscrupulous businessman, has instructed you not only to deliver newspapers to his customers, but to do so with such damage as possible to the property of non-customers.

As the non-customers' houses lack mailboxes you are forced to throw the papers

every customer and you get the three million in the daily press.

It's tough on the streets, especially when you're being hassled by thugs, mad dogs, stray lawnmowers and punks on skateboards - that's just on the pavement!

If you've moved into the road watch out for the gales, air-coming cars and roadworks. As your skill and confidence increases you can earn extra points by hitting these hazards with a copy of the Sun.

If you make it to the end of the paper round you are given a shot at the BBDX park. This consists of a series of air tracks, jumping ramps, slides, walls, and targets - a chance to race against the clock while practicing your skateboarding.

Paperboy has all the makings

through their windows!

Paperboy is a diagonally scrolling extravaganza, and the characters used are highly detailed and brightly coloured. Unfortunately the sound is not of the same standard, - the game is played in absolute silence.

Thinking there was a flaw on my 4028, I removed all peripheral and tried again, not a beep. I even ran it on a friend's 486.

A phone call to Elite confirmed there was no sound.

Paperbag brimming with ammunition, you cycle along the pavement as fast as possible. Grab the fire button at the right moment to hit the mailbags and "BOO" will flash on it.

Hitting the disc scores 100 points, putting it through the window gets you 50 points - but don't forget that missing the mailbox loses you the customer. Once this happens you can't get him back again - drastically reducing the number of points you can score. Lose

an excellent game - it's fast, it's exciting and it's totally addictive.

Max Anley

Presentation 85%

A multitude of options.

Graphics 91%

Cartoon style graphics and animation.

Sound 0%

Not even a beep!

Playability 90%

The more you play, the better you get.

Additive qualities 85%

A very refreshing game to play.

Value for money 85%

Get your hand in your pocket.

Overall 89%

But for the lack of sound it would have been an Acecade.

CHOLO

**Firebird
£14.95 case,
£17.95 disc,
joystick or
keys**

BEFORE I start singing the praises of Firebird's new star for the Amstrad CPC, let me tell you about my first journey inside the city of Cholo.

The bunker air was hot and stale as I pulled a chair up to the console, but I had a job to do. The city had been invaded, the inhabitants were scurrying underground, and I was their last hope for freedom.

The trainer produced a spinning picture of Flors, a Flat-type which I could move around the city. I looked out through the droid's electronic eyes and consulted the map. I was in the central computer building, and it was time to do some hacking.

Soon I'd located the Cyber 7 computer and logged on. This is going to be easy, I thought, as I read the password list into my droid's first compact.

Logging off, I left the building in search of prey. Just as I got through the door, I caught a glimpse of a droid - the chase was on! The little guy certainly could move, but the Flat was faster. A few bolts from the ion cannon and he was stopped dead in his tracks, motor circuits temporarily inoperative.

Slowly I moved up on it and logged on - I had not to take any chances at this stage, though it looked harmless enough. "Enter password".

Luckily I'd made a note of the password the first time I ran the compact. I was allowed these three, but they were all unsuccessful. The interface was

terminated, the little droid's repair circuits made good, and it was off.

It wasn't going to be so easy as I thought. I treated the droid and gave him another good pounding with the cannon. I logged on again, tried another password and got through. The droid's name was Igar, an odd sort of name I thought as I copied the contents of his compact into his memory, just for safe keeping. I could have switched control to Igar, but that was more powerful.

I left Igar and headed off in the direction of Stackco Robots Inc, in search of something with a bit more punch. I finished taking control of a Guard Robot with armor and a more powerful cannon.

Turning on to Bridge Street, something more useful - a Flying Eye - floated into view. Her name was Anetka and she flew like a droid - just what I needed to spy on the bunker head.

I wasn't sure how to get there, but I decided to follow the river. It didn't get her far before ion blasters started ripping across the hull and Anetka was dead before I could turn her about. She was just a surveillance droid, too slow to be of any use in that sort of danger zone. I'd have to seek out the Rat and fly again.

I have not been so impressed by any game since my first encounter with the bad guys in Elite. In fact Cholo could be described as Elite II.

In Elite your objective was to plot for battle between the star systems, make money and blast anyone who didn't agree. In Cholo your goal is much more definite and the execution is more subtle too. To free

yourself and the inhabitants of the city.

To help you there is a host of slightly misquipped robots. And the closer you get to finishing the game the drier they become. In one notable encounter, a guard was so bored of shooting at me that I removed my pair little droid into the river! Nice touch that.

In Cholo, as with every adventure game worth its salt, there always seems to be just one more obstacle around the corner, and there are plenty of cannon huns. The control keys are numerous with each robot trying a different set.

I liked Cholo, though the sound is a little poor. The 3D effects could be better too, as large buildings have a lousy habit of appearing right in front of you, though this does not detract from the game much and is little more than a minor irritation.

The manual is clear and concise, but due to the nature of the game, it doesn't give very much away. The manual at the back makes interesting reading.

In conclusion, Cholo is a worthwhile but low average game for players - men with all of the extra material. But for a game that is

possibly destined to become another classic it may be worth it.

The score is out, the lights are down and the inhabitants of Cholo await you.

GAME OVER

Imagine
£8.95 case,
£12.95 disc,
joystick or
keys

GEMMA is the powerful, vivacious, but deranged ruler of the galaxy. For many years you, the faithful Arkes, have led her armies to countless victories.

Recently you have begun to feel her unimpeachable threat to power diminishing, and so decide to make a stand against her. Will it be Game Over Gemma or Arkes Arkes?

If Arkes was so clever, why didn't he get the United Forces on his side before moving against Gemma? The game would have been much easier to play.

As it is, he has to battle his way across a planet that's crawling with Gemma's minions and fatal minesweeps, find a spaceship, and fly to planet number two. The fighting then resumes. But with much easier missions, it'll lead to a hard.

The planet Hynia consists of 20 screens, arranged side by side, which are revealed from left to right. Quite unusually for this type of game you are allowed to run back to previous screens should you wish to.

You are armed with a laser pistol and 10 grenades. Unless you're a trigger finger because there's no limit to the number of times you can fire the laser.

The grenades are lobbed in a graceful arc and have a blast rating four times that of the laser. The significance of this

becomes apparent as you reach the higher levels.

If you're to survive for any length of time you'll need to use the contents of the red and white barrels found on most screens. A barrel is revealed by shooting it three times – not as easy as it sounds as you'll be under heavy fire from all directions.

Barrels contain one of five items. Grenades increase your ammo counts by three, "POW UP" boosts the effectiveness of your laser and also increases the range of your grenades.

Catching a floating heart recharges your energy tanks. The energy shield enables you to walk through mines and laser fire unhindered, which is a real opportunity to give the badies some shot.

The only bad item is the mine. Steer on this and you blow yourself to pieces.

Gemma's minions come in six

different flavours, and that's just on the first planet. The guardian robots are airborne aliens who swoop at you, firing their lasers as they do so. These are little more than a nuisance and are destroyed with a single shot.

The Laser Shooters are a far more powerful adversary. Designed in design to a lightning bolt they fire a continuous volley of laser fire very accurately.

They can be deactivated with five shots to the head, but make sure you've got a fully-charged power pack before deciding to take one on. It's much easier to run through the laser and forget the three units of energy the collision costs.

Once you've got past the second Laser Shooter you'll find yourself out in the open – with a beautiful free-lined backdrop with metal platforms in the foreground, here you encounter for the first time green monsters which materialise from nowhere and fire high-powered lasers.

Lucky they are slow, cumbersome and easily destroyed. They are often accompanied by spaceships, which are only a problem when you're on a steep platform – the rest of the time they fly over your head.

When you reach screen 11 you'll encounter the first of the mega-monsters. The Giant Orks can sustain 40 hits before he dies, and it's about now that you wish you hadn't squandered your grenades. There are more big guys on screen 19. These to be precise, each one requiring 20 hits.

Assuming the gods are with you and you make it to screen 20, you can board the spaceship and fly to the Saturns. This planet differs from the rest in that the screens are arranged both horizontally and vertically.

The grenades have been replaced by a super blaster which will destroy anything in its path, but has a maximum of 20 shots.

Saturn is divided into four levels and phases, and has just as many minesweeps prowling its lands. Upon reaching the final screen you come face to

face with the Giant Guardian: this beast requires a staggering 75 hits before it is reduced to rubble.

Death is quite a pretty affair. Dropped into your constructed mine, you swirl from the screen in a blaze of energy.

Assuming you haven't lost all three lives you'll be reincarnated on screen one. You must then fight your way back to the front lines and continue your struggle.

Missed missions are still there, but our Laser Shooters are immobilised earlier remain immobile.

Game Over is an impressively challenging one-life game, an easy-to-lose affair. It responds quickly, looks brilliant, and fully deserves the Arkesade award.

CONVOY RAIDER

Gremlin Graphics, £9.95 cass, £14.95 disc, joystick or keys

CONVOY RAIDER puts you at the helm of an advanced naval ship piloting your country's coastline, armed with the latest in up-to-the-minute, ultra-defence systems.

It consists of half a dozen different screens, all representing a facet of the ship's functions. These can be selected using a simple loop system that can be slow but is simple to use.

First, there is the movement screen showing you the coastline and sea on which you plot your compass heading and speed 0-21 knots.

Second, there's the radar screen which gives you positions of enemy craft and third, there's a status screen which displays your points score and your ship damage. Finally, there are the three weapons systems around which the game essentially revolves.

Each system deals with a particular enemy threat (be it sub, ship, or plane) and is an individual action game in itself. Of the three, the laser missile is the hardest to control but, although quite realistic, are fairly easily mastered.

With control of these weapons, an idea of the enemy's position, and knowledge of the local geography you are ready to patrol the sea and dispatch any miscreant craft to a watery grave.

The graphics are very good. Yes, you may have seen better earlier, more colorful or more exciting effects, but the makers have sought to attain realism, something which they have achieved with ease.

The sound doesn't break new ground, yet it adds greatly to the atmosphere created - from the echoing rings of the radar screens, to the ship-shaking explosions caused by the enemy.

The only real drawback is one that most Convoy Raider's additional qualities - there seems little long term gain to the game other than the sheer mass accumulation of points.

After getting to grips with the various weapons systems you seem to be left in the lurch with few other considerations, such as fuel, and no apparent ultimate goal.

While this would be fine for a basic shoot-'em-up effort, for a program that purports to be a strategic game it is a little disappointing.

All in all, a refreshing, interesting game just lacking that killer punch.

Oliver Gilford

Presentation 80%
Good loading screen.

Not bad.

Overall 77%
Well-voiced, interesting alternative.

WIZBALL

Ocean/Imagine, £8.95 cass, £14.95 disc, joystick

Oh my, oh, my! This could have been so good. Actually it's not too bad, but it took me two hours to realise there was something wrong with the instructions, not my

trip through the wavy levels' systems.

Actually, none of the levels are particularly easy; the game is quite a challenge, and there are several surprises.

I've also played this game on the Commodore 64 and the Amstrad version. For ailed, suffers in comparison.

Wiggle! As you move left and right the screen is updated, it doesn't scroll. These times We got stuck on a floating

computer. Okay, so I'm slow.

The evil Zark has rendered Wizardworld into chaos and you ultimately your task is to put all the colour back.

You control Wiz - a ball with a face on it - and you have to avoid the badies. Some of the badies, however, turn into green gears and if you pass over them, seven boxes appear at the top of the screen and highlighted in succession.

Selecting an icon gives you more control (steps up/down, bigger weapons, smart bombs, a shield) and a cute mini-ball called Capote which follows you around.

To select a flashing icon you wiggle the joystick violently from left to right - don't press the spacebar as suggested in the instructions - it doesn't work!

When you shoot the badies some of them turn into coloured droplets which you must collect with Wiz. As you do you gradually fill up three conditions at the bottom of the screen with colour. You are told how many points remain on a screen which gives you an idea of how badly you're doing.

The same badies don't always appear on the same screen at the same time which keeps you on your toes and prevents the "another level"

Return-like sphere and wouldn't judge. And there is no multi-player version listed at in the instructions. The 84 version plays better, too.

It's still a good game, though.
Ian Waugh

Presentation 10%
Why don't they teach coding programmes to write instructions?

Graphics 86%
Nice shades of grey. Atmospheric.

Sound 10%
No music at all. It deserves more than a few beeps.

Playability 68%
Takes a while to get used to and the non-scrolling screen makes it easy for badies to sneak up on you.

CHAMPIONSHIP BASEBALL/FOOTBALL/BASKETBALL

Gamestar/Activision
£9.99 case (each),
£14.99 disc (each),
joystick or keys

These games like Channel 4 have done a great deal to bring major American sports such as Football, Basketball and Baseball to the attention of the British viewing public.

Gamestar is cashing in on this interest by releasing three new games, each devoted to one of these sports.

The games, although sold separately, have several features in common. All can be played by one or two people, using joystick, keyboard, or a combination of both.

Another similarity is with the instructions. These are very comprehensive. Basketball came supplied with instructions

in French and German only, so it was time to dust off the old 'O' level French and start to learn to listen (and to parlez!)

The baseball park is the setting for the first event of the day. As opening batsman you stride purposefully to the plate. It is at this point that you realise how clever the program is.

Your employer is viewed from above - a panoramic view of the white slab, but as the pitcher prepares to toss the ball, the right hand side of the screen changes to show a large shot of both you and the pitcher.

You time your swing by observing both the aerial view and the full-size display.

Depending on the state of the game, you control pitching, batting, running, or fielding. As pitcher you have a range of eight shots to choose from, while the batsman must rely on judgement and timing.

The summer can advance, winter, or even give the fielder - having stopped the ball he has to make the split-second decision which base to throw

the ball to

Goal use of graphics and a large helping of skill make Baseball my favourite of the three.

It is now time for the maiden day gladiators to take the field as we begin a thrilling game of Q11 Championship Football -

you choose the computer.

During loading you are asked to select both teams from four divisions of eight. By selecting yourself a good team and the computer a set of turkeys, you can gain an edge. If you consider this to be cheating, then again - I get persecuted by the lawyers!

Each game is divided into four periods of four or seven minutes. The mega-characters used in baseball are back once more, on a full-time basis too -

The computer kicks off and the ball spins high through the air as you, the receiver, try desperately to get your hands underneath it.

With the ball safely in your hands you charge up the field, trying to gain as much ground as possible. Weaving left and right avoiding the diving parties, eventually your luck runs out and you come face to face with 200 pounds of accelerating muscle.

From here on the game takes on the usual format - the team with the ball has four attempts for several to gain 10 yards.

Championship Football is challenging, both technically and mentally, but it hasn't the addictive qualities of Baseball.

The final game of the trilogy is Basketball, a game for the seven footers out there.

The scoreboard and one half of the court are displayed on the screen, skipping nimbly around the court are four players, two

of them are yours and two are not.

You control one of your two players, and there is no facility to switch control to the other. This isn't entirely necessary as the shots are automatically whatever you pass from the ball.

If you have difficulty playing games which require a great deal of skill Basketball may be of interest to you - it requires very little indeed.

It failed to hold my attention for more than half an hour and I soon found myself reaching for the Baseball tape again.

Neil Arty

Presentation 89%
 Very full instructions, even the French ones!

Graphics 85%
 Large characters are used wherever possible (except Basketball).

Sound 65%
 None of the games use sound to any great effect.

Playability 88%
 This score is for Baseball, Football's not too bad, but Basketball is a bit of a duffer.

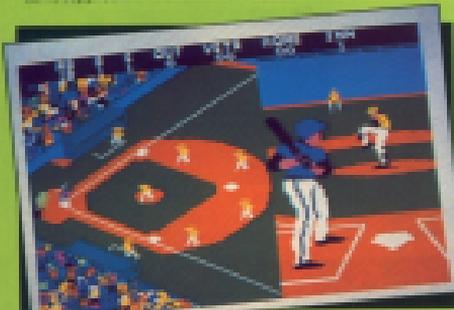

Addictive qualities 63%

A thorough read of the instructions is inevitable if you are to get the best from any of the games.

Value for money 65%

Baseball ... definitely, Football ... possible, Basketball ... no chance!

Overall 88%
 Purchase in the value for money order.

DEATHSCAPE

Starlight
£8.99 case,
£14.99 disc,
joystick or
keys

SUBTITLED The Warranes of Terra, this game takes you into the future where political disputes are settled by geo-political combat. The arena is a network of tunnels in which the two combatants, given an ship each, engage in battle.

This time it's the Red Feder-

generators and fortresses. The destruction of these results in extra missiles and fuel for your own ship.

The fortresses are particularly important as each of them contains a special code. It is only by destroying all ten and collecting their codes that you can have a shot at the Varg mother-ship.

As a shoot-'em-up Deathscape is disappointing as you are forced to zap and blast without discrimination or any special ability.

The game's strategic element does compensate for this a little, though not enough to

also end the treacherous Varg who must fight it out. Representing the former, it's your job to engage in deadly combat. This would have been a fair challenge but for the fact that the Vargs have sent a whole range of ships to destroy you.

The main screen displays the view from your cockpit. The instrument panel shows the usual equipment: shield status, fuel gauge, proximity indicators (to show whether you are touching the tunnel walls) and so on.

At the top of the screen a scrolling window transmits important messages, not least of which is your score. At the bottom of the screen two hands indicate the movement you are probably making with your own joystick.

With a choice of four speeds, you travel through the Deathscape tunnel, confining the range of Varg ships out to get you. At various points along the tunnel you can turn left or right (and even up and down on occasion).

To get an overview of your progress you must access the grid which shows your position, and that of fuel dumps,

Missile The Warranes of Terra much more than bright and colourful.

Ray Ramirez

Presentation 85%

Definable text, on/off music, shame about the ruffled playguide.

Graphics 70%

Colorful 3D, loved the bands at the controls!

Sound 63%

Close your eyes and it's a bit like Carter's last stand.

Playability 86%

As a shoot-'em-up it gets very monotonous; the strategy helps.

Addictive qualities 63%

Not one that's going to give you any sleepless nights.

Value for money 60%

If money's not strict obs. Otherwise, a slight pity.

Overall 61%

There have been too many games like this recently. None, even.

QUARTET

Sega/
Activision
£9.99 case,
£14.99 disc,
joystick or
keys

SPACE colony 404 has been captured by terrorists. An all out attack would result in the deaths of many hostages — this is a job for... the Quartet!

Sounding very much like a folk group, Lee, Joe, Mary and Edgar are the foremost anti-terrorist squad in the galaxy.

Each team member is a specialist in one particular field. Edgar is a powerful jumper, Lee is quick on the draw with his wide beam laser, Mary is the team's barista expert, and finally there's Joe, a guy who makes Carl Lewis look like a non-starter.

The game's preliminaries require you to select one or two members of the squad for your assault upon the colony. Any combination of joystick and keyboard can be used for control.

To complete a level you need to fight your way past numerous defence grids and locate the controller robot. Several well placed laser beams vaporise the robot, leaving a hole in its place. Just grab it and head for the exit — easy!

In order to release the insupportable boredom you will occasionally encounter a bouncing ball. Catching one which displays your initials will boost the power of the gun you are carrying.

If they've not your initials, shoot it and they will change. Other goodies include shields for temporary protection, clocks

to immobilise the robots and jet packs for better maneuverability.

The standard of the games is very disappointing. They are all simple, single colour designs. Minimal sound is used throughout the game, nothing so grand as a title tune, just the odd blip when you fire a gun.

Actually the game is far too easy. The first time I played it I got straight through to level 13, and I would have gone further were it not for a fatal error which necessitated my pressing the start button. There is a total of 16 difficulty levels through which you cycle continuously.

I suggest you play it wearing a blindfold while your partner taps out instructions in Morse code.

Steve Brock

Presentation 75%

Wide variety of options, but no high-score table.

Graphics 98%

The backgrounds are adequate, the sprites obvious.

Sound 42%

To say the effects are minimal is being kind.

Playability 36%

Anyone with an ounce of skill will find the game too easy.

Addictive qualities 32%

None that I can remember.

Value for money 35%

This should be a £1.99 budget game!

Overall 48%

Very mediocre in today's standards.

RAGING BEAST

Firebird Silver £1.99 cash, joystick and keys

AT first Raging Beast sounds like yet another combat game, but in fact it's fairly original. I presume it was originally titled *Go*, since this is emblazoned across the loading screen.

As if that were not a sufficient clue, the instructions spell it out. The game casts you as a cowboy in Plaza del Toros.

Your brief is clear – to last long enough in this ring with one bull. Afterward the bull, so that the crowd throw you a loop with which you are supposed to toss the Raging Beast.

Sounds easy? Well, no matter how many space invaders you may have destroyed in your time, this here bull is not too prone to defeat.

I must confess I have still not managed to succeed at this, and I consider myself a reasonably hardened game player.

The demo mode is quite good; there's some sound-effect music which gets the attention pumping before play starts, and several demo screens. One niggle is that it is far from clear when the game actually begins.

Still, what of game play? Graphics are primitive, and nowhere near the quality of many current budget offerings.

Sometimes it's hard to be frightened by a game about two character spaces high by three long. It might have been more convincing if there were not so much empty space on the screen – but you and Alliance are alone in the middle of the arena.

The slides are lined with

crowds – but these are poorly drawn. This is disappointing when so many games in the past have excelled with very similar backgrounds. One of the interesting features of the Niagara-type games is the superb background graphics; not so here.

However the real drawback is that moving around is both high-impedance, it seems to take ages for your character to respond to both joystick and keys.

This made it hard to manoeuvre, which is needed at times even if the bull does move rather slowly. All in all, one of the definitely missable of the latest budget crop.

David Lester

Presentation 50%

Great inlay picture, clear instructions.

Graphics 30%

Small and jerky.

Sound 50%

Appropriately energetic backing here.

Playability 25%

Wary, very hard to move where you want to, when you want to!

Additive qualities 30%

Playability and small graphics make this one to forget.

Value for money 35%

Lots of better games around, even for two pounds.

Overall 40%

Only for those with either a raging hatred of bulls, or Spanish blood.

F-15 STRIKE EAGLE

Microprose £9.95 cash, £14.95 disc, joystick or keys

THIS Microprose release places you in the ejector seat of one of America's most advanced fighter planes, the F-15, ready to embark on a chase of seven different missions over enemy territory.

A graphic display split into

Microprose has indeed succeeded.

For technical accuracy does not equal realism, and I would have thought the whole purpose of such a game would be to convey the feeling of excitement and tension that must affect F-15 pilots.

In this respect, the program simply fails to convince anything other than boredom. After a while it becomes obnoxious to the mass of keyboard options presented and was simply content to blast away at anything

bird radar, electronic warfare display, WSO weapons status display, HSD (horizontal situation display) and, of course, the pilot's view out over the cutting horizon gives you an overall perspective of the job in hand.

Using the joystick to control pitch attitude of the aircraft, the guns, launch missiles and drop bombs, and the keyboard to adjust the throttle, with a lot of practice, you can soon achieve basic manoeuvrability.

After choosing your mission, your first task is to plan your flight path, using the HSD to identify your current position and the location of the primary target.

The navigation sensor has to be placed on target, and the steering cue will guide you to it. Under typical war conditions, heat-seeking missiles will attack, together with radar-guided missiles and enemy aircraft.

To summarise all the options available would probably take as long as the normal USAF training course for fighter pilots.

In terms of attempting to cram all the possible control variants into one program,

that approached my skill.

With a jerky updated vector-graphic style presentation, and the most basic of sound effects, F-15 Strike Eagle represents a last opportunity to really put you in the pilot's seat.

Victor Lewis

Presentation 65%

Very detailed instructions with masses of controls.

Graphics 60%

Jerky, lots a lot to the imagination.

Sound 50%

There is sound.

Playability 70%

Responsive controls and plenty of action, but too many keyboard options.

Additive qualities 60%

Reasonable, but won't get you overwhelmed.

Value for money 65%

Try before you buy.

ADVENTURE

THERE has been a noticeable upsurge in the number of excellent readers who have written in recently with comments, criticisms and praise about this column. I'd like to welcome them and say that they should feel free to write in and raise any points they like. As regular readers will know, I welcome any correspondence and will print anything relevant.

All Hughes is one of those new readers and he has indicated some excellent tips and solutions. I'd like to thank him and reply to a comment in his letter about his lack of knowledge about the solutions published in past columns.

To help ALL new readers and possibly even regulars, I am going to compile a list of all solutions and maps published since May 1990, the month I first started printing them.

I hope to compile this in time for next month's column. Should there be any maps or solutions that interest you as a result, back issues can be obtained using the order form on Page 67.

Phillip Mann has written in to say

that he has seen the past solution to Morston's Queen published earlier this year and would like help in reaching the adventure development area. The first part of the solution, which details how to reach this area, can be found in the June 1987 issue.

D. Worthington wants help with Lord of the Rings part I. He's reached the location East of the hedge where the game seems to 'wash'. I met this location within a few minutes of starting to play the game and as far as I know this is definitely a bug. If any

reader has managed to pass this point I would be interested to know.

I'd like to thank Paul Whittingham for his excellent map and solution to Dungeons, Amethysts, Alchemists 'Y' Everything'.

I published a solution to it in the September issue but have made use of Paul's map to help any adventurers who is in difficulties.

Next month, I'll be starting a series of maps of the Pass to complement Graham Wheeler's solution that ends in this issue.

READERS' HALL OF FAME

Adventure Quest - Part 2 of a solution by Gwyn White. (Part 1 last month).

Go to the tower, get the eye and the rope then return to the cave and throw the eye. Tie the rope to the stalagmite - note the white dot on the roof.

Climb down to the ledge which gives way and precipitates you into an underground river. Keep trying to go up and you will eventually get on to a ledge. Get the lung fish taken you find there and then keep dropping and getting it until you are told that you can't breathe. The lung fish changes your metabolism so that you can either develop gills to breathe underwater or have your lungs to breathe normally. Dropping and getting it toggles between the two states.

Go down and up until you arrive on

a beach. Revert to your lungs, make sure the lamp is lit then examine your surroundings. You will discover all the possessions you threw away earlier and a net.

With the net, bag and trident only, switch back to gills, enter the water, find the church and catch the jelly fish. Make your way to the West end of the deep trench, then go down and note the hole. Anything dropped here will be carried away to a later location. Find the cave, enter it and open the bag to store away the octopus. Drop the net and note the white dot on the wall. Go out, up and back to the shore and revert back to lungs.

With the bottle and lung fish, swap back to gills and cross the lake. Revert again to lungs and go West into the cave with the black dot. You are now in the building.

Get the keys and the medallion, refill your bottle and go back to the wall. Drink to quench your thirst then fill the

bottle with oil and return to the beach.

Take the lung fish, keys, lamp and oil, cross the lake and light the lamp then oil and unlock the door. Drop the keys - you won't need them anymore.

Leaving everything but the lung fish, return across the lake for the trident, the medallion and the stick. Recross the lake - opening the clam on the way.

Go down to the hole noted earlier and drop the medallion and stick down it. Get the eye from the South side of the lake, drop the trident down the hole and go to the North side. Revert to lungs and fill the bottle.

With the eye, bottle of water and lamp, enter the cave. Avoid the arrows, find the statue and give the eye to it in exchange for a sword. Find the dragon, throw the bottle at it then discard the bottle - you won't need it again.

Turn to Page 27 P

READERS' HALL OF FAME

The Power — Part 2 of a solution by Graham Wheeler. (Part 1 last month)

With the clue in mind, make your way to the clearing in the forest and examine the stump. Get, open and look inside the pouch. Mix the blue, red and green to get 'white' — your light source. Now go to the tree, climb it then use the wooden key to unlock the door. Enter and close it behind you then push the planks. You will find a route down inside the tree and must use it.

Go to the passage near the crossroads and open and enter the door you find there. Examine the book to get and wear the hard hat then examine the statue and the resultant cushion to get the coin.

Travel next to the lift and push the button. When you hear the lift arrives, pull the door, go North and get the rope. Press the second button and go to the workshop. Once there, get the lamps (at least) with the trowel. Leave the tree and visit Trader John.

Buy some ale and whisky with the coin then go to the caves near the rocks. Find the cave with the Raven statement and drop all your possessions. Go East to the Lava river cave then up until you get to the riverside chamber. Break the wall and you will be swept back to the cave by a torrent. Get all your possessions and return to the Lava cave and you will find that it is now possible to head North over the Lava river.

Once over, examine and move the pedestal then examine the niche to get the blue key. Go to the alchemist's laboratory and give him the rice and lead. Now go to the store rooms, get the aerosol then cast a spell on the rooms and read them — they tell of a pact between Kronos and the Devil.

Make your way to the room with the paper wall and cut the wall with the trowel. Drop the trowel and pull the

subboard. Tie the rope to the hook, climb down the rope then drop it. Go South to the double doors and keep knocking until the power opens them. When he does, give him the whisky and drop your light.

Go through the doors, down the shaft and visit Jerry in the arena. Give him the ale then pay the Devil a visit. Ask him about the wristband and he tells you he'll remove it if you kill Kronos and then transports you to the rope bridge.

Get the potion bottle then return to the room with the paper wall and get and climb down the rope. Take the light and go back up the rope to the dragon's chamber to examine the shadows. Point at the hobbits then shine your light at them. The dragon can now see them and will eat them instead of you.

You can now go North into Kronos' workshop and throw the bottle at him. Point the aerosol at him and press the rocks. Take and wear the hat and drink then take the weed. You will now be disguised and able to get back past the dragon.

Travel to the plateau and melt the snowman with your light. You are now free to enter the tower but should note that doing so doesn't score you points, even for freeing the princess. Mind you, if you are at all cautious I expect you to do so anyway. Be careful not to open the top lower door with the blue key. If you do, you will lose the key and the opportunity to vote later.

Go back into the tree and down into the office. Lift the rug and unlock the safe with the blue key. Sit then vanishes. Open, examine then search the safe to get the papers. Take them to the voting booth and put them in the large ballot box.

Return to Hell via the rope in the room with the paper wall, remembering to leave your light outside the double doors, and give the aerosol to

the Devil who will remove your wristband.

Make your way back, collecting the light, and climb back up the rope to the cream door. Knock on it and you will be asked if you are wearing a wristband. Answer and when it is opened, enter. You will be given a list to correct and should find your score is 290 points. The game is now completed.

Feed hints: The carrot, tea pot, top hat, rabbit, amulet, green boots, chick, rose, wheelbarrow, princess, prism and — if you don't climb the stairs in the tower — the boots.

The Power points table.

Getting rope from Kronos5
Putting plant in pot with trowel5
Examining shed5
Giving rope to guards5
Climbing rocks5
Finding pouch used to mix 'white'5
Finding coin5
Asking Devil about wristband5
Getting gems to give you food10

CAN YOU HELP?

Peter Van Cauwenbergh has written from Belgium for help with Heave on the Magik. He has Alastair's map from the November 1998 issue but still requires further assistance.

He would like to know: what the passwords for the three exits are, the password for entering room 2.53 (practical — philosophical), how to pass the cyclops in 1.63, how to get past vampires, the meanings of the garb

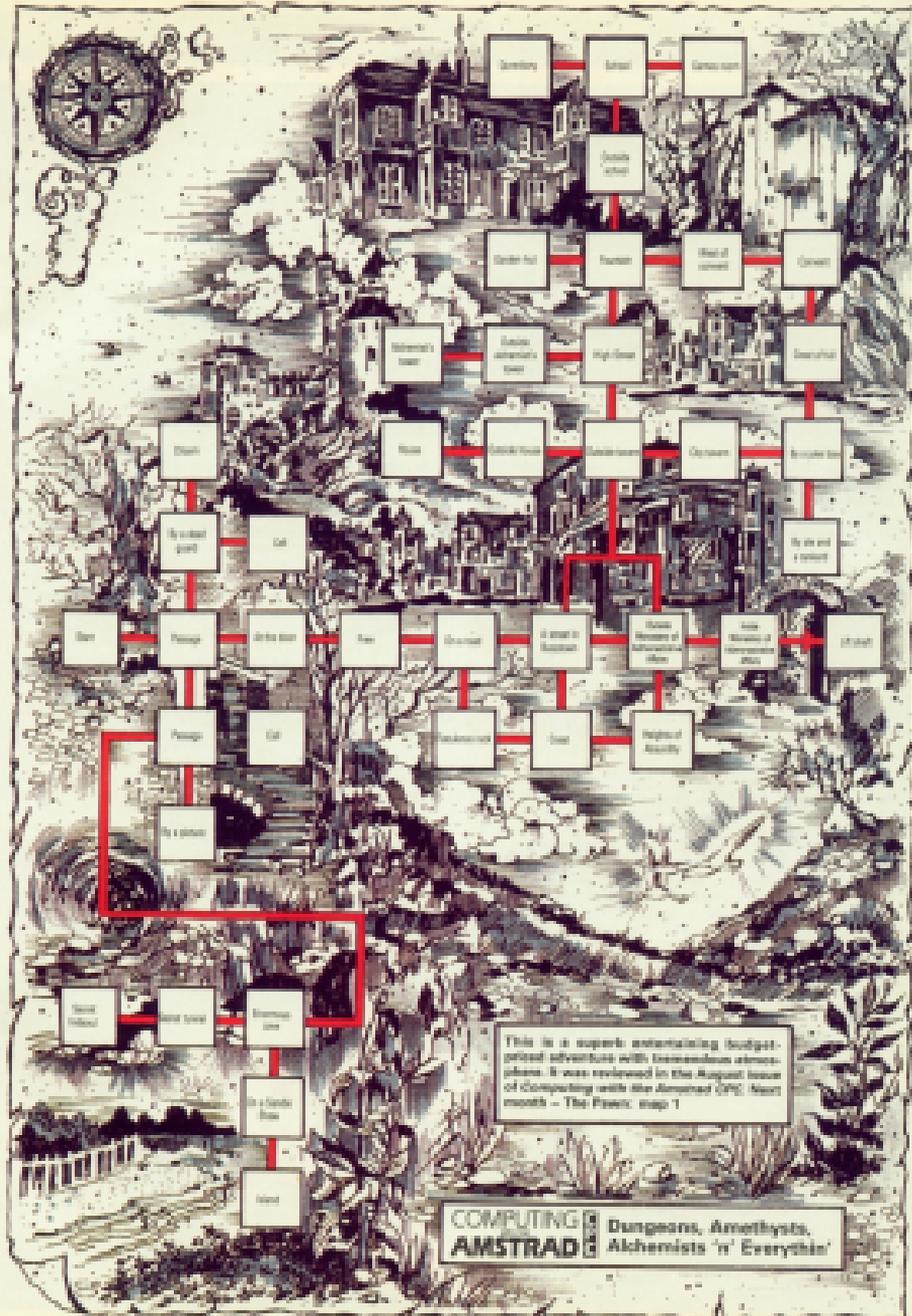

in room 1.19, the pellet in 3.1, the snake in 2.5, the egg in 2.13 and the mirror in 3.29, what you do with the number of magik, the steel in rooms 1.39 and how to reach the nest in 1.64 (how to pass first). I hope this makes sense to owners of the game and if you can help, please write in.

Paul Sawyer is in difficulty with Lord of the Rings Part 5. Can anyone help him to get across the ferry at

Bucklebury?

Stephen Lawson, a regular contributor to these pages, is having problems with Questprobe 3. He can't seem to manage to get anywhere as the Thing keeps drowning in the tar pit. I haven't seen this game (A hint for the competition perhaps?), so can't help.

Has any intrepid adventurer overcome this problem?

This is a superb, entertaining budget-priced adventure with tremendous atmosphere. It was reviewed in the August issue of Computing with the Amstrad CPC. Next month - The Power - map 1

COMPUTING **AMSTRAD** Dungeons, Amorphysts, Alchemists 'n' Everything!

WHEN they wanted me I was going down the drain again, I was rather pleased. The Sewer in question is no ordinary drain, but the brainchild of Martin Lee, winner of Domark's Design a Game contest, and I reckon it's destined to make its teenage author a big name in software.

A big name, yes - but not an overnight success. It was almost six months since the initial meeting between Martin, Domark and Design Design, the Manchester coding wizards who are turning the blueprint into a program.

My article in the June issue gives full details of that winter meeting and the decisions made that were to have a resounding effect on the young designer.

Since then Domark has moved to a new, more spacious HQ, Martin Lee has continued with his college courses, and Martin Welch has started work on the code.

Essentially the deal came and we gathered in the Domark boardroom one Monday afternoon to see what we had got, and what we had got was water - flowing water! Now it may not sound a dramatic development, but this one brief routine had been causing Martin Welch endless headaches, as he explained.

"The problem is to get it to go round things," he said, as he submerged the screen again. "If you just have it spreading out it will fill just the screen sideways when it reaches a ledge, instead of flowing down." None of us could think of a game which had tackled this free-moving problem before. Martin had made one false start and scrapped everything before he hit on the solution.

The game now uses linked lists which divide the water into a series of groups, depending on where it is in the maze. As the maze fills up the surfaces are linked together by the water. And if you don't fully understand that, don't worry - neither did most of us around the table. We just nodded sagely and admired the effect.

Program development is often a case of cracking certain problems and developing units of code which can then be strung together to give an impression of the game. This means that though the initial progress may appear to be very slow, sudden leaps will soon ensue.

The process is also one of constant refinement. Domark's Richard Naylor spotted the case of the living Daylights, which was just approaching

Another dash down the drain

JOHN MINSON provides a progress report on The Sewer

its final stages. "A single screen was taking up almost all the memory, but then compression techniques reduced it to a tenth of that size."

The water routine was considerably overnight, taking up a massive 20k but there were no worries about putting it on a crash disc. The only regrets were that, in the end, the general public will never realise just how clever and compact a piece of code it is. As Richard put it, "They'll say, Water - so what?"

This led quite naturally to the question of how big the game could be. After all, you can only compress so far. The original idea had called for 10 levels, each three screens by three, and this still looked possible, providing large building blocks were used to conserve memory and each level had the same dimensions.

Then somebody asked about scrolling. Martin Welch turned white. While Graham Stafford, top man at Des-Des had agreed to this feature at the first meeting, the news had failed to filter back to the programmer. But everything happens in memory before it's transferred to the screen display, and Martin assured us he could handle it, providing the player charac-

ter, the Manipulator, wasn't in action at the time.

Now there was some code, it was necessary to discuss the original design again in the light of what could or could not be achieved. The way the rocks would behave caused considerable consternation.

For starters, Martin Lee wanted to know whether they would sit rather artistically on top of each other or tumble and pile naturally. Then somebody else asked whether you could trap yourself with falling rocks, and if so, what would happen if the Manipulator had nowhere to throw them.

Martin Lee had a solution to the last problem - crumbling rock. At this stage it seemed a wise idea to define the types of stone you might encounter while you clear The Sewer. Dave Carlos, head of Inter-Medias, who handles Domark's PR, suggested four types - permanent, collapsible, a type that can be eaten by acid, and crumbly rock which should look quite innocent until you tried to land on it.

But this led to its own series of problems. For instance there was the question of how permanent rock would behave when thrown by the Manipu-

The team behind the Sewer: The programmer team in action

The Fish

The Rat

The Sewer

later. The complexities of calculating trajectories meant that we'd just have to have an extremely powerful Manipulator that can shoot it as far as you want.

It was also okay to have acid-eating rock — a few flashing pixels could provide a satisfactory erosion effect — but Martin's plans called for a hungry fish. There would have to be a separate type of stone, as there could be a rule about what was edible, and Martin Welch reckoned he'd need four frames of animation to gobble a Boulder.

But fish was nothing compared to the snails that leave a trail which can be used like glue. That meant each block of rock would need an extra flag to indicate whether it was sticky — and each block has four sides! So a block needs two bytes, one for the display and one for how it behaves. "It's getting quite complex, isn't it?" Richard Naylor sighed.

As if to confound things further, Martin asked about pipe-laying. Being a sewer, there are a number of pipes, and these can be used to direct the flow of water — "Perhaps to siphon it," somebody suggested. The problem is that though the Manipulator has to be able to build pipes, it can also drain. "Isn't that a bit illogical?" Dave Carlos asked, only to be cried down.

So everyone treaded around for a while with various ideas such as taps, until it was decided that you can only extend an existing pipe, which is capped while you're working on it.

This was further developed at the next meeting, and it now looks as if you'll be able to use the pipes as a safe transport system. That's really a case of going down the drain!

"Will you have to rescue all the men on a level?" we wondered. If Martin put too many workers in peril it's possible some would have to drown. "How about having some who can't be rescued anyway, so players only

waste their time if they try?" The person who voiced this ruthless suggestion will remain nameless.

After several hours of hard slog it looked as if the meeting was about to break up, with a general agreement to get together again in a month's time for another progress report, when it was hoped there would be more graphics to see.

Martin had also thought of some puzzles, but needed to create a complete screen, working on graph paper with each square representing a character block.

As we filtered out I asked Martin's Dad, who had come down with him and sat in on the meeting, what he'd thought. "It's social work," he told me, "and I thought our case conferences were tricky and detailed, but this..."

"But you're dealing with people", Dave Carlos laughed. "We're dealing with these horrible things", and he indicated the micro, "which don't do what you say".

A month later there was rather more to see. Design Design's graphics artist, David Fish, had come down and we all tramped into Donsart's programming room to take a look at some of the characters he'd come up with.

Code was downloaded from a PCW to a CPC, complete with a system which allows the sprites to be animated at different speeds and blown up or reduced to their game sizes.

It was quite a thrill to see the menaces that will populate The Sewer come to life after all this time. Everyone was extremely pleased with the results too. There's a vicious snapping fish, which has a fantastic, wiggly swimming motion and we all liked the rat, but as Martin Lee points out, it's missing its ears. David promised to sort these out.

There was also a sample screen to watch. The Manipulator could move

around it, pushing blocks, as the water trickled in, slowly filling the space. At least the game looked as if it was getting somewhere.

Back in the boardroom it transpired that all the worries about rock types, from a month earlier, had become redundant. Back can have any combination of characteristics, which include whether it's affected by gravity, if it crumbles or if acid eats it. Dave Carlos even suggested there could be a sort of liquid rock or slurry.

All in all, this leaves room for 16 variations — seven more than the original plan called for. When Design-Design provide Martin with a screen designer he'll have a lot more leeway in creating ingenious puzzles.

With the programming progressing so well it was time to look ahead to the next steps in the process and to think about a release date. Though it couldn't be finalised without further discussions with Donsart, DesignDesign were able to suggest a completion date. That meant Dave Carlos could set his press campaign into action, advertisements would have to be planned, and packaging could be designed.

Dave wanted Martin Lee to meet one of the buyers for a major software supplier. "When will you have a version we can show people?" he asked Martin Welch. The target date was set as mid-August. As Dave said, "We could carry on programming for ever. We have a very complex program, but there has to come a point when we say stop".

That point has now been reached. The programming is near an end. The next item on the agenda is the selling of The Sewer!

■ We will be returning to The Sewer once more to see its completion and launch. Will the deadline be met? Will the final result justify all the effort? Read the final instalment of this fascinating story — soon!

Hacker II

A popular strategy game simulating the infiltration of a high security complex somewhere in Siberia. Exciting and realistic when experienced on the Amiga.

RRP....£24.99

The Music Studio

This piece of software has been especially included in this pack, as it fully exploits the outstanding musical capabilities of the Amiga 500, giving you all the benefits of a professional sound synthesiser. MIDI compatible.

RRP....£34.99

Joysticks

2 high quality joysticks included, enabling full use of your Amiga and software from the very start.

RRP....£5.99 EACH

- ALSO AVAILABLE
OPTIONAL EXTRAS**
- AMIGA A1081 COLOUR MONITOR (STEREO) - **£375.00**
 - AMIGA A1010 EXTERNAL DISKDRIVE - **£285.00**
 - AMIGA A501 512K RAM EXPANSION - **£112.00**
 - AMIGA A521 TV MODULATOR - **£24.00**

Link your Amstrad CPC to the outside world with...

MicroLink

When you join MicroLink you've got the whole business world at your fingertips - 24 hours a day. You'll have immediate access to ALL the facilities offered by Telecom Gold ... and a great deal more besides.

Electronic mail - The cheapest and fastest form of communication possible. It costs the same to send a message to one mailbox as to 500!

Telex - Link up with 86,000 telex subscribers in the UK and 1.5 million worldwide. You can even send and receive telexes after office hours or while travelling.

Telemessages - Type in your message before 8pm and delivery is guaranteed by first post the next day (except Sundays), anywhere in the UK and USA.

Teletasking - Reserve train and theatre tickets, check flight details worldwide, or order from a vast range of products - from flowers to floppy disks.

Advice - on a team of professional legal and financial advisors as and when you need them, for both business and personal problems.

Company - Obtain facts about any British limited company in seconds, and fully analysed financial information on over 100,000 major companies.

Typesetting - Send copy from your word processor together with details of type size and style, and you'll receive pages ready for printing within 24 hours.

News - Use the powerful search commands to pinpoint vital business information from the world's leading news services, newspapers and periodicals.

Redteleging - If you also have a pocket teletypewriter you'll be alerted each time an urgent message arrives in your mailbox. So you're always in touch.

Gateways - Get through to New York in just five seconds - or any into the BBC computer in Luxembourg, which links you to 600 databases throughout Europe.

All you need - apart from your Amstrad - is a modem, which plugs into your telephone's wall socket, an RS232 interface and suitable communications software.

We have provided a list of possible combinations (left), ranging from the very cheapest to one which can automatically dial the MicroLink telephone number and connect you directly to the service - all you have to do is type in your personal security password.

Whichever equipment you use, you will be able to call MicroLink, open your mailbox, see to clear any messages waiting for you, and disconnected in as little as two minutes.

Typical options packages

- A** **Chart**: Acoustic V23 modem + RS232 interface + tape or disk communications software (£25-40)
- B** **MODE**: Minimax V21, V22 autodial modem + RS232 interface + communications software (£30)
- C** **Flex**: Nightingale V21, V22 manual dial modem + RS232 interface + Commaxcom (£150)
- D** **Flex**: Linnex V21, V22 autodial modem + RS232 interface + Commaxcom (£210)

More than 90 per cent of subscribers can connect to the MicroLink computer at local call rates.

TO FIND OUT MORE Fill in the coupon and send it to the address below. We will provide full details of services and costs, together with an application form. Complete this and return it to the address below to see if you are eligible for one of the services of MicroLink and Telecom Gold.

Please send me full details about MicroLink, and information sheets about the following hardware and software systems (please tick):

Make fabulous music on your Amstrad

For the first time you can create sounds, write music, add drums, and even control other instruments - all from one single, easy-to-use system.

- Record ANY external sound, alter it and play it through the keyboard
- Create exciting rhythm patterns with up to three sampled drum sounds on any beat
- Write your own music using the on-screen facilities
- Plug in headphones or listen through your HiFi
- Link to other musical instruments using the built-in Midi interface

... and every pack includes an easy-to-understand user guide, and microphone.

As reviewer Ian Waugh found (CWA/CPC July 1987), Music Machine is a lot of fun and remarkable value for money.

Suitable for	Product	Format	RRP	Special reader offer	TOTAL SAVE

Keep perfect **CPC** time on your

Here's a highly-accurate quartz-controlled clock from d'Itronics which plugs into the back of your computer.

- You can set the alarm to ring from once per second to once per day - perfect for reminding you of appointments when you're engrossed in typing.
- There's a built-in calendar with days of the week, date, month and year - and it recognises leap years.
- Now you can automatically date stamp your CP/M files so you know the exact time and date that each file was updated.
- There's also 50 bytes of battery-backed ram in the interface for you to use for other purposes.

The unit is powered by a rechargeable Ni-cad battery which should never need replacing, and there's a through connector so you can attach other interfaces.

Normally **£34.95**

DISCOLOGY NEW

This is the ultimate in disc utilities. Discology consists of 3 programs, a disc editor, a disc explorer and a disc copier.

The copier

- As the size of floppy systems, we could see that either disc Discology could not back up (excepted). This really is the most powerful copier you require for your Amstrad.
- Makes full use of all 128K on a 5.25".
- Highly intelligent compressor, also allowing verification to be copied in one go.
- Full file copies, may multiple files in one go. Will copy with files of any length.
- Copies files from drive to tape.

The editor

- Edit any sector, including format formatted sectors.
- Display in 256 character, hex listing, hex, ASCII, binary, and 8 decimal.
- Search files for a given string.
- Dump pages to printer.
- Built in full floating point calculator, for technical conversion etc.
- Exceptionally easy to use.

The explorer

- A new concept in disc utilities.
- Graphically magnificent interface.
- Shows the whole system on soft disk and displays on which sectors files are stored.
- Display full sector information and file information.

PLEASE ADD £1.00 PER PROGRAM FOR OVERSEAS POSTAGE

SIREN SOFTWARE 2-4 OXFORD ROAD, MANCHESTER M1 5QA.
TELEPHONE: 061-228 8831

Discology makes comprehensive use of all full drive access and in a superb addition to any disc system software collection.

Discology makes extensive use of all 128K on a 5.25 and all 64K on a 464. This 100% machine code program offers everything you could dream of plus more.

Discology on disc only £14.95 CPC464/525/6128

Upgrade - Make the most of your Masterdisk, in 200K we will put Discology onto 200K of your Masterdisk. Upgrade price a mere £10.95 plus your Master Disk.

ROMBOARD OFFERS SAVE £30

I EXPLAINED last month how variables are used to store a value for later use in a program. I also left you with the tools of writing two procedures, one that would take two parameters and use them to draw a regular polygon; the other to return the average of two numbers.

The most obvious way of writing `poly` is like this:

```
to poly :sides :size
  repeat :sides
    [
      fd :size
      rt 360 / :sides
    ]
end
```

and typing:

```
cs
poly 4 100
```

will draw a square with sides 100 units long. A circle is a polygon with an infinite number of sides but a computer screen has a limited resolution so you can approximate circles by specifying a large number of sides:

```
cs
poly 10 10
```

You've probably noticed how slow Logo is. In `poly` the angle is calculated each time round the loop in the fifth line of the procedure. For a given value of `sides` the result of the calculation is always the same.

So by calculating the angle every loop cycle the program is doing unnecessary work. If we do the calculation once before the loop starts, it

```
to poly :sides :size
  setc 360 / :sides
  repeat :sides
    [
      fd :size
      rt :c
    ]
end
```

should run faster.

Try timing how long it takes to draw a circle with the two methods. You'll find the second `poly` is quicker.

With a little thought it's often possible to improve a procedure so that it either runs faster or uses less memory, sometimes both.

Things that stand out ahead procedures or programs that can be improved in this way, are that they tend look ugly, cluttered and use lots of instructions to do a simple task.

Moving on to the average number problem, the following will serve as an example of this same point. I suspect those of you who haven't programmed before will have spent some considerable time coming up with the first of these `average` procedures, or

A pressing appointment

IAN SHARPE on Logo's conditional and keyboard input commands

something like it:

```
to
to average :num1 :num2
  ask 'or :num1 + :num2
  ask 'or :num1 / 2
  or :num1
end
average 1 2
to average :num1 :num2
  or (:num1 + :num2) / 2
end
```

The second version, however, gives the same result using less memory and is quicker because there are fewer instructions. It also looks neater and is easier to understand.

If you haven't already guessed, the round brackets (or parentheses) change the order in which an expression is evaluated. If you miss them out here, Logo will work out `:num1/2` first and add the result to `:num1`.

We can write a program where a particular set of instructions is only executed if a given condition is true, otherwise it skips over them or perhaps executes an alternative sequence.

In this way we can give programs rules so that different courses of action are taken according to the circumstances. Logo has a powerful command to cater for this — `if` which can be used in two ways, as the following procedures will illustrate.

```
to test1 :num
  if (:num > 0) or (:num = 0)
  or 'finished
end
to test2 :num
  if (:num > 0) or (:num = 0)
  or 'not :num
end
```

Type these in and enter:

```
test1 4
test1 1
test1 0
test1 1
```

The rule for `if` is: if the condition in round brackets is true, Logo executes the list of instructions in the square brackets that follow. So in either of the procedures, if you type its name followed by 0 you'll see that's all printed on the screen, followed by the end.

If the condition isn't true — the number isn't 0 — there are two possibilities. In `test1` there's an alternative set of instructions — also in square brackets — executed when the condition is false. So with `test2`, passing a parameter other than 0 will print the second message.

When you do pass 0, the first message is printed and execution skips over the alternative instructions and starts again at the finishing message.

In `test1` when the condition is false there isn't an alternative set of instructions, so Logo jumps over the list in square brackets and carries on.

Having demonstrated the principle let's look at some more examples and use the opportunity to read input from the keyboard. Before we do, however, you'll be wondering about the square brackets after `pr` in the last two procedures.

Up to now we've been feeding `pr` with the output from a variable, a word preceded by a single quote, a number or the output from another procedure. If you want to print a message consisting of several words supply `pr` with several words in a form that constitute one object. I said in a previous article that putting square brackets round a group of objects makes them into a list. A list is a single object that may contain several items, so putting the message in square brackets:

```
pr [hello there fred]
```

will cause `pr` to print out the list with a carriage return at the end — just what

Turn to Page 42 ▶

► From Page 47

we want.

Right, back to the keyboard. Procedures often need to get information from wherever is using the computer and of course Logo has commands to handle keyboard input. The simplest is `to` which is short for read character. This waits for you to press a key and when you do it outputs the character typed.

```
to wait
  read "What is
  if 10000
end
```

In the second line it waits for you to press a key and the typed character is put into the variable `char`. The third line simply prints `char` on the screen. Let's develop that a bit further.

```
to wait
  go[[class on 50
  read "What is
  if :char=0
    go[[Thanks very much!]]
  if :char=0 then wait]]
end
```

The first three lines are self explanatory. The `if` statement is the type that has alternative sets of instructions. If you press the `A` key (unshifted), the condition in parentheses is true, so the first set of square brackets is executed.

If you didn't press the right key, the second set of instructions is taken instead. In this case, when the `wait` message has been delivered the procedure is run again until you get it right.

Here's another example, this time using graphics. It waits for you to press `L`, `R` or `F` (for left, right and forward) and moves the turtle accordingly.

The only new features here are `label` and `loop`. These provide a means of jumping to another part of a procedure, so when the three `if` statements have been dealt with, Logo jumps back to the point identified by `label`.

Instead of the procedure running just once, the instructions between `label` and `go` are executed endlessly because `and` is never reached. If you want to stop the procedure, press Escape.

```
to doodle
  go
  if :press L or R
    label loop
  read "What is
  if :char=0
    if :char=0
    if :char=0
  go loop
end
```

You can't jump to another procedure. When it finds a `go` command Logo only looks inside the current procedure for a corresponding label. It's possible to have several `go` and `label`, but the lower ones are the better.

Perhaps you can add to doodle? How about a means of lifting and lowering the pen, locking up the turtle, clearing the screen and so on?

Experiment with a `go loop` after `if R` and `if F` and see how it speeds things up. How about commands which use `pen` to draw triangles, squares and circles?

► Next time we'll meet other ways of reading the keyboard, and have a preliminary look at lists.

Think **BIG**
and get yourself
noticed

IAN SHARPE finds Tas-Sign a way to get good notices

ADDING a printer to your computer can transform it from an expensive toy into a generally useful piece of equipment. For most people printers mean word processing, hard copy from spreadsheets or databases, graphics or program listings.

Now Tasman, author of one of the two most popular Amstrad word processors and many other printer-related programs, has added another use to the list of possibilities.

In conjunction with your CPC6128 or CPC6032/48512 and dot matrix printer Tas-Sign will enable you to produce sign writing in a variety of styles and sizes. It runs under CP/M plus and is a surprisingly versatile piece of software.

Tas-Sign differs from simple "big character" programs in the range of layout options and the quality of its output. Whatever scale of magnification you apply to the characters, slopes and curves are always drawn at the limit of resolution of your printer.

So a C eight inches high is not composed of an 8 x 8 matrix with inch tall rectangular pixels. Instead it's a smooth curve, and only if you look very closely does the stepping (or aliasing) become visible.

Tasman has achieved this by storing the character shapes as mathematical descriptions rather than matrices as found in your CPC6128 manual. To look at it another way, a circle draws using a formula to calculate the position of the points will be smooth if enough points are used, whereas

drawing a large circle by simply magnifying one plotted in a matrix will produce a crude, chunky shape.

Four character sets are supplied: Standard, Western, Casual and Block. Casual looks as though it has been produced with a nib or brush and Block is a stencil-style font. Each can be printed in a huge range of sizes with a horizontal stretch factor, either normally or in italics and with optional underlining or inverted colours.

There is no facility to design your own character set. At first this might seem like an omission, but the complex way in which characters are stored would make writing such a utility a far from trivial task.

With this in mind, it's a pity that a set of graphics characters wasn't included as this would have greatly enhanced the package. Space is tight on the disc, but there is room for one more font, so how about it shape?

Characters are plotted in one of a choice of fill styles, ranging from solid through various combinations of horizontal and diagonal stripes.

The patterns can be printed in single or double strike, single or double density and there's an option to have the print head make an additional pass to fill in the spaces between dots. The fill pattern can also be used to surround the finished article with a border.

The ability to draw outlines of characters, leaving the centres blank, would have been useful, because I think it might be preferable on larger signs to spare your printer ribbon and

fill in the shapes with poster paint.

As well as character size, font and fill style, the program offers control over most other aspects of the finished appearance.

There are three spacing options. Characters can be printed at a regular pitch or proportionally, in other words the spacing is adjusted according to the letter involved to give a more even appearance. The latter option can be further refined to include kerning where letters that overlap, such as the combination WA, are placed closer together.

Text can be printed horizontally for smaller signs or vertically for large banners. The gaps between lines are definable and commands to centre text on the page or align it with the right edge complete the picture.

The text of your sign is input row by row in the editing screen, which is shown in Figure 1. You don't design your sign on-screen - instead the final appearance is controlled by setting the various options and embedding commands in the text.

The best approach is to have your sign planned on paper with the settings and commands worked out before using the program.

The commands can be referenced either from the manual or by scrolling the Help screen to the appropriate point. As well as setting up the various options in the editing screen, the facility to embed commands can be used to turn on underlining or swap to

Turn to Page 44 if

In the March 1987 issue of *Computing with the Amstrad* we introduced you to recursion and fractals in our Oregon Curve program. It generated a lot of interest so here is something more on a related subject — trees.

We had a look at these back in May 1986, but the method was crude and this time we're going to put the results to some use.

Trees caught my attention in *Microcomputer Graphics* by Mike Batty (Chapman Hall 1987 ISBN 0 412 26546 5). The author introduces simple graphics routines and develops them into interesting picture generating programs.

Poor old Mike uses the BBC Micro for his examples (we all have our crosses to bear), but BBC Basic does have procedures which can be called recursively with local variables and Mike takes advantage of these features to generate his trees.

Of course we don't have procedures on the Amstrad and using Robin Nixon's bit-on routine from the May 1987 issue would have been admitting defeat. So I set about writing my own tree routine to get round the problems and came up with Program 1. It's not an adaptation of the BBC Micro version but a different way of producing the same results.

The idea is that the tree is composed of branches, and at the end of each two new branches grow. At the tip of the new branches are two more and so on. You can see what I mean in Figure 1.

Before we see how it works try it out for yourself. You will be prompted for three parameters — angle, depth and size. Angle is the angle of the V between two branches, depth is the number of times the tree is to subdivide and size is the length of the stem between its start and where it first splits into two. To begin with, try

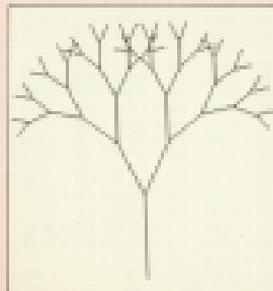

Figure 1: A simple tree

PAINTING BY NUMBERS

IAN SHARPE expands the idea of mathematical trees to produce some attractive landscapes

values of 45, 8 and 110 respectively. Also have a look at 120, 10, 150, 180, 15, 200 and 270, 10, 200.

What happens is that every time a V is drawn the program calculates the coordinates of the tips. It takes the right-hand fork, draws a line to the tip and in the array stack it stores the details — size, coordinates, angle — of the left-hand tip which it can't deal with yet. It repeats the process, always taking the right fork and storing the left until it has gone to the required level held in depth.

If you think about it, the maximum number of left shoots stored in stack can't be more than depth. When the required number of shoots have been drawn by taking right turns, the

routine backtracks in stack to the details of the last left turn it missed. The program uses a pointer — ap — to keep track of which part of stack it is taking its parameters from.

It follows this new route, again always forking right and remembering places it needs to come back to. In this way nothing is left out and eventually the entire tree is plotted. At this point there are no more parameters stored in stack. The program detects this and comes to an end.

To obtain the trunk, stack is initialised with just enough information for one leg of the first V.

Program 2 — Landscape — uses a

NEARLY
£500 IN PRIZES!

Hit that perfect beat!

Up for grabs this month are TEN Amstrad drum machines for the Amstrad CPC. Cheetah's Amdrum is the best-selling peripheral which has delighted thousands of would-be rock stars.

It converts your computer into a programmable digital drum system using digital recordings of real drum sounds to achieve very realistic results.

Amdrum comes with a kit of eight different drum sounds for £24.95. But every prize winner will also take away three additional tapes each containing eight new voices and a Kit Editor: Latin Kit, Electro Kit and Afro Kit - worth £12.97!

How you can win

All you have to do is answer the three questions, fill in the coupon (or a photocopy) and send it to the address below to arrive no later than October 31.

The senders of the first ten correct answers to be pulled out of the sack will each be sent a Cheetah Amdrum and three data tapes.

The questions

- 1 Which German electronic group (whose name means "power station" in English) helped pioneer the use of drum machines?
- 2 Which heavy metal band has a drummer with only one arm?
- 3 Which white reggae band had a number one hit last year with Christie Hynde?

Exolon

(Hewson)

Here's my Amiga debut — Hewson's Exolon well and truly seems to have been hard at work with it because it's brilliant and I decided to give you a head start with a guide to the hardest of the first 25 screens.

Then just before going to press, ace hacker Christian FINDER came up with not only a guide but the built-in infinite lives cheat mode as well. The man's a genius! Infinite lives takes all the fun out of it so this is a last resort before murdering your cat, goldfish or cabalistrant. Go to the define keys option, type ZORBA for your key selection and you'll hear a short jingle.

Now select the keys you actually want and you'll be able to look cannons and birth pods in the eye, switching off cheat mode is the same process again.

If you just want to make things a bit easier, use the poke which gives you a sporting chance with any number of lives you want.

I think you'll need a blonic right arm, a brain enhanced with a single-chip implanted microprocessor and an RGB video input socket in your forehead to complete it with only ten lives.

Roland's like that, but on damn mornings we have to sleep him with HQ40 or he just sits there, shorted out.

Now here's a quick dip round the first section. First, some general advice:

- If you hang around too long, an indestructible missile will appear and finish you off.
- Cannons can only be destroyed with a grenade but be careful, the fragments can bite a bullet. The safest thing is to duck until they're gone.
- Pressing Esc will pause the game while you read these words of wisdom and gulp down a much needed soft drink. Control+Shift+Esc will abort and take you back to the menu.
- On screens where a stream of badies emerges from the right, the best method seems to be to keep blasting and bounce up and down as you move towards the exit.

Blue spheres can be difficult and it's important to time your jumps. If they get you pinned down, it's difficult to recover. You need to master the art of ducking at the right moment and bouncing up again, guns blazing.

With birth pods, make sure a hail of blaster bullets arrives as the grenade hits. Bounce up and down as you finish off the bad mops.

There's a lot of blasting to be done but sometimes you have to get through several screens before finding an arena dump so you'll have

to learn to be accurate.

1. Move right, duck the bullets, grenade the cannon and rock formation, wait screen right.
2. Get to the right of the teleporter, blow up the cannon (duck while you're launching). Teleport to the top and exit.
4. Grenade straight away. Move right blasting spheres until at the edge of the platform. Grenade, drop to the bottom blasting all the time, bounce and blast your way to the exit.
6. Walk four blocks to the right, lob a grenade at the birth pod. Duck, bounce and blast, just back from the top of the step. Try to get in phase with the blue spheres.
7. The first double launcher. Come out blasting. Keep bobbing down but don't jump. I find the best way is to keep my finger on Right while jabbing at Fire and Duck. Get close enough and it'll stop. Teleport to the top and exit.
8. The best way is to stay at the top, so walk to the right until your rear foot is at the edge of the platform. Jump to the next platform, do it

again and exit. If you fall to the lower level, launching a grenade before you hit the bottom may get the cannon, otherwise it can only be hit when you're past the first mine. Between mines you'll need to move back slightly before jumping over the next.

9. Stand in the teleporter. The rocket homes in on you, so wait until it's about a screen-ish away and teleport down. Grenade the green missile guidance module and deal with the birth pod.

10. Don't move! Grenade the missile base and edge forward until your foot is one pixel away from the edge of the hammer. Wait for it to sink. Just as it disappears, move quickly to the central space. Do the same with the second hammer. Enter the chamber. If you want double blaster and armor, press Jump. You get less points this way, but getting through the rest of the screen without there is for masochists only.

11. Things get difficult. The easiest way is to teleport to the top but the next screen is a bit easier if you take the

bottom route. Move right, blasting the shells. It takes careful timing to hit the missiles as well but get close enough and you'll destroy them as they emerge. You can't afford to bounce and you're very close to the launcher.

13. Get to the teleport as soon as you can. Sometimes the cannon fires too rapidly to let you through. One bullet, sometimes two can be jumped over. If you want extra points, break right up to the cannon and give it a grenade, but this could easily cost you lives. Exit at the top.

14. If you haven't much ammo, teleport past the launcher. Now walk back to a far your beavery bases - thanks to John in the office for that one. If ammo isn't in short supply, walk into the launcher to get points for hitting shells.

15. If you've got any ammo left, maximise your score by standing to the right of the teleport and use it up on the blue spheres. Teleport to the top, collect ammo and grenades. If you're ammoed, don't worry about the hammer.

16. Exit at the top but before you do, the birth pod and base are easy reach. Don't linger to get the last few reds as they spread quickly and you'll probably lose a life.

23. The missiles with their

top wings in the roof are difficult to hit but can be dodged. You must hit all the others but if you get pinned down you won't be able to.

23. Start bouncing and firing immediately. You can grenade the far base if you launch when your nose is just pasting from behind the pillar. Drop down to the bottom. Take out the second base and a few spheres. Pick up both sets of supplies.

23. Don't panic! The squid loco round so you've just got time to grenade the coal scutes before the first wave comes at you. As you go right you'll have to bounce to get all the squid. Let too many through and you'll get pinned down.

24. You need one grenade and plenty of ammo. You have to get at least as far as the first jet before you can grenade the top part of the cannon/magic launcher. Sometimes you can get close enough to avoid shells being fired.

25. Bonus screen - just touch the right pillar.

On later screens, to get past the force fields you need to put about 25 rounds of ammunition into the field to destroy it. Hitting the base unit as hunting grenades has no effect.

As with cracking Exolon in second time, Christian has come up with no less than eight more policies for various games. Over to you Chris.

Hi, I'm Tiffany Wood and from now on *Aestiva* will be under new management - mine! Before getting on with the show I'd like to thank Terry for his super-human efforts over the last few years and wish him a long and happy retirement.

I'm quite about games but I'm not very good at programming yet, so keep the tips and policies rolling in. If you don't, I'll get very lonely (not to mention being out of a job) so I'm relying on you folks! And it's about time we saw some from the girls as well.

If I can't use your contribution straight away, I'll hang on to it and maybe fit it in a later issue. Remember though, you've got to send in your own work. If you copy from any other Bob, Dick or Harry, you'll get me into terrible trouble with the editor. So don't! Not Aot ever, now the good bits.

Instead of one person hitting the free software, we're going to pay for every poke, tip and hint we publish. What you get will depend on how much work I think you put in and how nicely you ask. In any case you'll get enough for at least one budget game.

Tiffany

Stormbringer (Mastertronic)

This one does all sorts of naughty things, infinite strength being the least of them. At the top of the screen you'll get a print out of the objects you are carrying and your strength, even if you haven't got the mirror.

You'll be able to tele- phone without the telephone pad. You'll also be able to read magic writing without the crystal ball,

command characters without the wand of command and use the travel-to-person spell without the magic missile and the crystal ball.

Reload the tape to the beginning. CPC664/6128 owners need to type (TAPE before using the poke. Run it and press play.

Soon I should be able to bring you a complete solution and map.

Terra-Cognita (Codemasters)

This one has lots of different features. All you have to do is remove the lines corresponding to the ones you don't want. For example if you don't want infinite lives, remove line 170. Just run the tape and press play to play.

1942 (Hit Pak)

This is for the tape compilation version and will give you rapid fire, 255 lives, infinite ammo and let you roll by pressing Shift or spacebar instead of the 1 and 2 keys.

To use the tape, skip past the parts of the game called after and connect.com and position the tape in front of the part called code. Then run the tape and press play on the tape deck.

- 5 Wheel
- 6 Rings
- 7 Helicopter
- 8 Tubes

That's about it for this month. I took up a lot of room with Exolon, but I should be able print some of your tips 'n' puzzles next month.

Before I go, I'd like to give a quick plug for the fans down at Incentive Software. They've sent me a demo disc of screens generated with their new 3D environ-

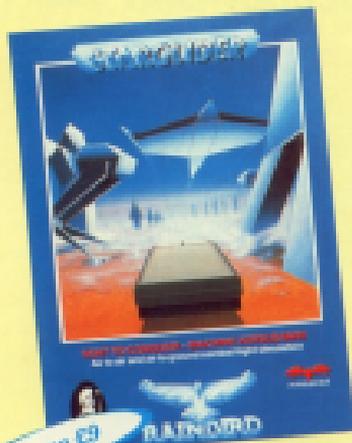

ment simulator, Freeescape, which will feature in the game Driver.

The pictures are all in solid 3D and it looks like a real leap forward from wire frames. According to Roland and Ian, the problem might be the speed with which each frame can be drawn, so we'll have to wait and see if it's as good as it looks.

Save £9

Plus JEWELS OF DARKNESS
...three great adventures in one!

Three classic adventures from Level 9, now totally rewritten to incorporate the latest innovative adventure-writing techniques, with a huge 1,800-word vocabulary, over 600 illustrations and ultra-fast response times.

You start with *Colossal Adventure*, containing all the treasures, creatures, rooms and puzzles of the mainframe original.

Next is *Adventure Quest*, where even greater perils await you.

Finally *Dungeon Adventure* challenges you with the ultimate struggle against the forces of darkness.

Also included in the package is a 64-page novel, with a 18-page playguide.

THE arrival of Advanced Memory Systems' Stop Press (Programmer) for the CPC caused a surge of interest in desktop publishing among home users. Despite its many problems when first released, this program has been very successful.

The quality of its output is superb, but the dot matrix printer needs to spend well over an hour producing a high-quality page.

Even in draft mode this can take at least half an hour. And more if you wanted to reduce this time there was only one option — buy a laser printer. However, it is now possible to speed up page printing with the programs presented here.

It is interesting to consider why the print routine in Stop Press is so slow, and to do this we need to understand the layout of a page. Stop Press constructs it out of 560 rows, each of which is 114 bytes wide. When saved to disc the page is cut horizontally into four strips and put into separate files.

The problem is that a single row using one pin of the print head is 1/216th deep, and some simple arithmetic shows that 560 rows would only be three quarters of the correct length for A4 paper. It seems that Stop Press prints every row twice with a 1/216th line feed in between. This makes every row about one third deeper, so the page is stretched to fit A4 format.

It also makes it so slow that a second hobby is needed to pass the time while waiting for it to finish printing. The obvious solution is to have more rows, but that would mean using more memory which is in short supply in Stop Press.

Program I works by printing seven rows at once which considerably reduces the time taken. There are still only 560 rows to a page and the bottom row of each set of seven has to be repeated to get the correct page length.

The time taken to print a page is now approximately 15 minutes, with only a small reduction in quality — certainly good enough in most cases. Choose draft mode if you really want to speed things up. Have some of the rows are repeated, so a gap is left between each block of seven. It might not look too great, but it takes even less time and is useful for checking page layout.

Program II must be typed in and saved before running. It generates the machine code which is then saved as PWDSON.DM. Program I loads this code and then asks for the required print mode, and will then prompt you to insert your page disc and let you select the page you wish to print.

Each of the four files which make up

Quick on the draw

JOHN BLESSING puts Stop Press printing into top gear

a page are loaded in turn and control passes to the machine code. The Escape key is not tested during printing, so if you want to stop you will have to remove the disc before the next quarter page is loaded.

Stop Press is fussy about the type of printer it will drive. Generally speaking it will work with Epsons and others

which expect 560 bits in graphics mode. Many printers use 1280, so the page tends to be squashed in the left two thirds of the paper.

If you have this problem do not despair; if there is sufficient interest, a later article will describe how a full-width page can be produced even on these printers.

 Prize letter

NOT long ago I switched from Tasword to Protex on my PC. The Tasword files load into Protex in program mode and when I type DOC to get into document mode the formatting commands don't work.

In Sharpe's text file computer article in the August issue brought enlightenment as to how to convert Tasword files to real Protex documents that will obey formatting commands. I now realise the problem is due to a hard carriage return at the end of every line and formatting fails at these.

So to help other readers who may have been experiencing the same problem here are some notes on converting from Tasword files to Protex documents.

- Printer control codes are stored differently so you'll need to change them.
- Make sure your Tasword file is not right justified and has no margins or you'll have to get rid of lots of spaces in Protex which handles justification and margins differently.
- You need to convert your Tasword files into Protex documents as they won't reform properly when you edit them. To do this use the two-line program that accompanies the text file computer in the August issue.

If you use it by itself on Tasword files it has the disadvantage that words get joined together at the end of lines when you reform. So you'll need to either go through afterwards separating them by hand or you can follow this procedure:

- Open the file into Protex and put a double carriage return at the end of every paragraph. In other words create a blank line.
- In command mode type DOC.
- Type R for Replace.

Converting from Tasword to Protex

- When asked for the FIND STRING type `^L`.
 - When the REPLACE FROM prompt appears choose a two-character combination that doesn't appear in the text such as two curly brackets.
 - The last two steps are a temporary measure to convert all the double carriage returns at the ends of paragraphs to something that won't be affected by the next steps.
 - Select `Replace` and replace `{} with ^L` using `Find string = {}` and `Replace with = ^L`.
 - Go back into Basic with the `Q` command, type in and run the two-line program.
 - Go back into Protex with `PR`.
 - Replace the curly brackets with `^L` to retain the blank line between paragraphs or replace with `^L` to close the file up again.
- It's not quite perfect, but it does all the hard work and is particularly useful on longer documents.

In conclusion, I'd like to say that Tasword has given long and faithful service and my only reason for changing was that I own a CPC464, need more file space and this was the cheapest way of getting it. — John McMorris, Swindon.

Packing in the facts

HERE are two useful hints. Firstly, as a university student wanting to organise revision notes in a compact form for easy reference I found that I could save a huge amount of information on a page by using condensed subscripts and a

smaller line feed of 5/72in.

This allows me to scan and summarise a large amount of information without carrying a sheaf of notes around.

Recently, using the CPC464/DOC/Protex.com combination I recently spent four hours typing in a document without taking a backup.

When I tried to save my work to disc the computer crashed and all was lost. I traced this to a wobbly connection between the interface and rom board.

When I start work I run a short configuration program to set up ink colours and key definitions. Adding the following to this program helps me with regular backups.

```
on 1000000:1000000:
 1000000
```

Now pressing `B` on the numeric keypad quickly makes a backup which I now do at the end of every paragraph. — John Terry, Oxford.

Second drive for 6128

I HAVE a fairly modern 3.5in disc drive which I would like to use with my CPC6128. Can you possibly help as to any modifications I have to carry out to enable me to run it?

It would also be a help if I could use it as drive C as I already have a second 5in drive as drive B and it would avoid continual disconnections. — M.J. Fisher, Maidenhead.

Without details of the drive we can't tell you what you need to do with it.

Normally the maximum

Win a tenner

Each month we award £10 prizes for the most interesting letters sent to us.

So now there's more reason than ever to contribute to our lively letters page.

Get your pens out, start writing and you could be one of the winners.

The address is: Postbag, Computing with the Amstrad, Large House, Chester Road, Hazel Grove, Stockport SK7 5NY.

number of drives allowed with a CPC is two but Remantic Robot, 15 Mayland Close, London NW6 6LN, may well have the answer to your problems.

They have a new disc operating system and utility rom called Rodeo which will allow multiple drives of different sizes. The one we saw demonstrated had a silicon disc, a 5.25in and two 3.5in drives in addition to the Amstrad's internal drive.

At the time of going to press we've had Rodeo for only a few days. We haven't tested it with some drives other than a silicon disc.

It doesn't work under CP/M and file copy utilities will not recognise anything other than the conventional A and B drives.

On the other hand, it will

Turn to Page 56 ▶

4 From Page 25

configure as a silicon disc and printer buffer any extra ram such as the second 64k of the CPC8128 or the 4KTronics ram packs.

With a specially formatted disc it will also allow you to use directories.

Monitor upgrade

I own a CPC464 with colour monitor and wish to upgrade. If I buy a CPC8128 with green screen card I use the colour monitor with the CPC8128 and sell the CPC464 with the green screen? — Derek, Lightfoot, Greenock.

■ Although the CPC464 would work with the CPC8128 monitor, the reverse is not true. The CPC8128 disc drive takes its power supply from a socket in the monitor which is not present on CPC464 versions. You would need a separate power supply for the disc drive, such as an MP2 modulator, but this would be a umbric arrangement.

Trouble with tapes

SINCE we have both a CPC8128 and a CPC464 in the family we often want to transfer our basic programs from disc to cassette to enable wider use.

In every case, after apparently saving successfully to tape, any attempt to load or run the program back on either CPC results in "Read error 0" immediately after the heads.

I'd be grateful for your advice as to whether my CPC8128 has a faulty tape port. — R.M. Jones, London.

■ It is possible that your cassette port is faulty, but the most likely cause is your tape recorder.

We can't diagnose at a distance and unless you are prepared to take your CPC8128 for testing there

COMPUTING
WITH THE
AMSTRAD

Postbag

We welcome letters from readers — about your experiences using the Amstrad, about tips you would like to pass on to other users... and about what you would like to see in future issues.

Stockport SK7 5NY

isn't reach you can do.

If your recorder is a sophisticated hi-fi unit, the noise reduction system may be responsible — cheaper mono decks are the best.

Try cleaning the tape heads with a cleaning cassette, as dirty heads are often a source of trouble.

If the recorder has more than one input or output socket, try all combinations. A stereo radio/cassette we use will only work with output from the headphone socket and not the one marked "line out", input split to the two "mic" sockets and not "line in".

Set to mono operation with the volume and treble turned two thirds up.

Borrow another recorder and see if that works. If it does, your own recorder is at fault. If it doesn't, have your computer tested.

Xorlent

I HAVE just typed in Ripple by Jill Barnes and Xor by Josh Dawson from the August CPC. I think these are the best pattern programs I have seen for some time.

FD-lines is a good idea and I always type them in. By the way, I had to put the run statement on a new line in Xor as it made the line one character too long. — Ian Leonard, Preston O11180298.

■ Glad you liked them. Line 25 of Xor contains 255 characters which is the maximum allowed and works perfectly as pub-

lished. You must have typed in an extra character, probably a space.

Checkpoint

RECALL could you send me a copy of the check-out utility as I'm having trouble getting Scanners from the August CPC to work, and as a new reader I don't have the June issue. — Mike Harvey, Jarrow.

■ Sorry, but we really haven't the facilities to send out free photocopies of tapes of magazine listings. The June issue is available using the mail order form on Page 61.

Echo text with DMP1

RECENTLY I bought a DMP1 printer and have found it very useful for graphics and word processing. I think I've got to grips with my printer but I have a problem.

How can I set up automatic printing so that whatever's printed on the screen will be transferred to the printer?

Also could you tell me how to draw a circle half way through a program without wiping any variables currently in memory? — Jonathan Meechell, Lancaster.

■ The facility to echo screen output to the printer can be very useful, but requires a utility program to achieve it.

We have just such a utility but it's a bit too long for the

letters pages. We'll print it as a separate feature in the near future.

Circles can be drawn easily enough. At the point where you want to draw one, put the values and the x,y coordinates of its centre in the variables rd,rc,cc respectively and GOSUB to the following subroutine which can have line numbers to suit your program.

If you don't use the variables it uses for anything else, it won't affect the rest of your program.

If the routine isn't fast enough for you, obtain a copy of the November 1985 issue which had a machine code circle utility.

Quality from a TV ...

After Watkins's problem in the August issue about connecting a Sony to his CPC may be due to a mismatch between the Amstrad's RGB output and the RGB input of his television.

I have successfully connected my CPC6128 to the input of an ITT television, so it can be done.

Amstrad informed me that the RGB output is 1.5 volt across 50 ohms but the general standard for video RGB and composite signals is 1 volt across 75

£10 Prize letter

ohms. So putting a 39 or 47 ohm resistor in each of the RGB leads will improve the matching.

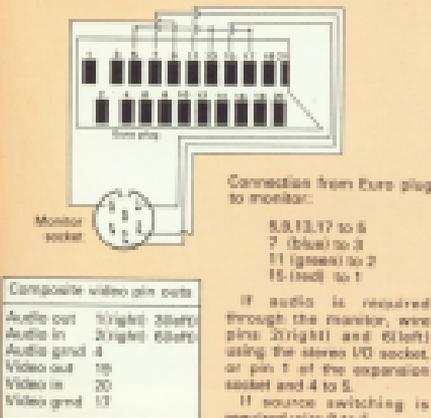

This will prevent the RGB signals being at such a high level that the television thinks its receiving white when it is really a more subtle hue.

I am satisfied that correctly connected RGB and sync signals can make a television into a colour monitor far superior to Amstrad's own. — A.S. Squire, Slough.

... and how to connect up

£10 Prize letter

In answer to your question in the August 1987 issue about connecting up an Amstrad to a better monitor, I've done it, and the diagram explains how to make up the wire. — Martin Burke, Coventry.

miss the shutter mechanism. You aren't going to believe this, but the file loaded and was subsequently saved to another disc. — A.P. Johnston, Hilo.

■ You were incredibly fortunate that the file on directory wasn't on the deleted track, that the disk

didn't interfere with the head, that the hot coffee or radiator didn't corrupt the magnetised surface, and the subsequent washing didn't leave a residue.

With that kind of luck, if you ever fancy a day at the races let us know — we'll all come with you!

Compiled by Gallup/Microscope

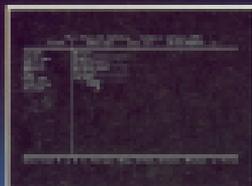

The chart is not so dominated by budget titles this month, and eight new entries have changed its appearance quite drastically — especially with Paperboy from Elite going straight to number one. Read the review in this issue.

All this in just

WORD PROCESSOR

Compose a letter, set the print-out options using embedded commands or menus, use the mail merge facility to produce personalised circulars – and more!

DATABASE

Build up a versatile card index, use the flexible print out routine, do powerful multi-field sorting, perform all arithmetic functions, link with the word processor – and more!

LABEL PRINTER

Design the layout of a label with the easy-to-use editor, select label size and sheet format, read in database files, print out in any quantity – and more!

...and at a price

Mini Office II offers the most comprehensive, integrated suite of programs ever written for the Amstrad – making it the most useful productivity tool yet devised.

A team of leading software authors were brought together to devote a total of 26 man years of programming to the development of Mini Office II. What they have produced is a package that sets new standards in home and business software.

The sample screenshots above illustrate just a few of the very wide range of features, many of which are usually restricted to software costing hundreds of pounds. Most are accessed by using cursor keys to move up and down a list of options and pressing Enter to select.

Is it that easy to use? Several leading reviewers have

already sung its praises on this very point.

Yet possibly the best advertisement for Mini Office II is that it comes from the same stable that produced the original Mini Office package back in 1984.

That was so successful it was shortlisted in two major categories of the British Microcomputing Awards – the Oscars of the industry – and sold in excess of 100,000 units!

It was up to Mini Office II to take over where the first Mini Office left off, with 32 extra features, two additional modules, a program to convert existing Mini Office files to Mini Office II format, and a 60 page, very easy to follow manual.

This is the package thousands of Amstrad owners have been waiting for – and at a price everyone can afford!

ONE package!

SPREADSHEET

Prepare budgets or tables, total columns or rows with ease, copy formulas absolutely or relatively, view in either 40 or 80 column modes, recalculate automatically - and more!

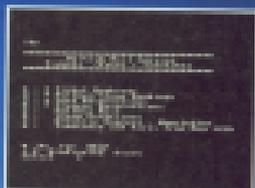

GRAPHICS

Enter data directly or load data from the spreadsheet, produce pie charts, display bar charts side by side or stacked, overlay line graphs - and more!

COMM MODULE

Using a modem you can access services such as MicroLink and book call or theatre tickets, send electronic mail, telex and telemessages in a flash - and more!

ethat can't be matched!

Here's what some independent reviewers say about **Mini Office II**:
"Mini Office II is a real gem. It's a great value for the money. It's a great package that offers a wealth of user-defined functions... For the money it really is unbeatable. Additional word processors, spreadsheets and communications packages may offer some extra features, but none are as full of options and bells as this little package. It's the nearest to some real value for the money. What you get with Mini Office II is a value package in general, an all-encompassing small business package at a price in most prices is really off its beaten, and there's nothing to see about the features it provides." *Database Systems 128*

Rated Business Program of the Year - 1988 AND 1989
"Praise Computing Weekly"

"This package is incredible value. It includes a word processor, database, spreadsheet, graphics display, label printer and communications module. You could well spend over £200 to get the same range of functions if you bought separate programs from other firms!"
Daily Mail Home Computing Guide

Amstrad CPC 464, 664, 6128

THE
AWARD-WINNING COMBAT
FIGHTER SIMULATION

F-15 STRIKE EAGLE

- Thrilling blend of authentic action and
highly accurate combat flight simulation
- Outstanding 3-D graphics
- Multiple combat modes
- Realistic views of aircraft
- Hundreds of weapons and tactics
- Realistic mission programming

The Combat Fighter Simulation

The most highly realistic, award-winning combat simulation of your
F-15 Strike Eagle will give you a sense of what the most highly advanced fighter ever made is like in the sky and
challenge the accuracy of the other combat simulators available for combat only.
Each year you need 100,000 to fly the real one. The goal is to bring a sense of that mission to you. Southern Area active
combat only.

Use it to help you learn the tactics, weapons and maneuvering involved in the real world of combat. You'll be able to
fly the real one. The ultimate simulation of modern fighter tactics.
F-15 Strike Eagle. The ultimate simulation of modern fighter tactics.
Available for Commodore 64, IBM, MS-DOS and Commodore, Mac II, XL, Power Macintosh, and Amiga. Call 800-871-1111
