# Sinclair ZX81 Personal Computer

## the heart of a system that grows with you.

1980 saw a genuine breakthrough – the Sinclair ZX80, world's first complete personal computer for under \$300. Not surprisingly, over 50,000 were sold.

In March 1981, the Sinclair lead increased dramatically. For just \$199, the Sinclair ZX81 offers even more advanced facilities at an even lower price. Initially, even we were surprised by the demand – over 50,000 in the first 3 months!

Today, the Sinclair ZX81 is the heart of a computer system. You can add 16-times more memory with the ZX RAM pack. The ZX Printer offers an unbeatable combination of performance and price. And the ZX Software library is growing every day.

### Lower price: higher capability

With the ZX81, it's still very simple to teach yourself computing, but the ZX81 packs even greater working capability than the ZX80.

It uses the same micro-processor, but incorporates a new, more powerful 8K BASIC ROM – the 'trained intelligence' of the computer. This chip works in decimals, handles logs and trig, allows you to plot graphs, and builds up animated displays.

And the ZX81 incorporates other operation refinements – the facility to load and save named programs on cassette, for example, and to drive the new ZX Printer.

**New BASIC manual**

Every ZX81 comes with a comprehensive, specially-written manual – a complete course in BASIC programming, from first principles to complex programs.

### Higher specification, lower price – how's it done?

Quite simply, by design. The ZX80 reduced the chips in a working computer from 40 or so, to 21. The ZX81 reduces the 21 to 4!

The secret lies in a totally new master chip. Designed by Sinclair and custom-built in Britain, this unique chip replaces 18 chips from the ZX80!

### New, improved specification

- Z80A micro-processor – new faster version of the famous Z80 chip, widely recognised as the best ever made.
- Unique 'one-touch' key word entry: the ZX81 eliminates a great deal of tiresome typing. Key words (RUN, LIST, PRINT, etc.) have their own single-key entry.
- Unique syntax-check and report codes identify programming errors immediately.
- Full range of mathematical and scientific functions accurate to eight decimal places.
- Graph-drawing and animated-display facilities.
- Multi-dimensional string and numerical arrays.
- Up to 26 FOR/NEXT loops.
- Randomise function – useful for games as well as serious applications.
- Cassette LOAD and SAVE with named programs.
- 1K-byte RAM expandable to 16K bytes with Sinclair RAM pack.
- Able to drive the new Sinclair printer.
- Advanced 4-chip design: micro-processor, ROM, RAM, plus master chip – unique, custom-built chip replacing 18 ZX80 chips.

# \$199

Price includes connectors for TV and cassette, FREE manual, sales tax, post and packing (but excludes mains adaptor).

**Announcing The Complete Sinclair ZX81 Basic Course** – Takes the mystery out of writing programs! This attractive lay-flat reference manual contains 240 pages of information illustrating the use and possibilities of the Sinclair ZX81:

- How to write programs
- A permanent work of reference
- Numerous examples
- Every function covered

ter-

**Available now-  
the ZX Printer  
for only \$190**

**16K-byte RAM  
pack for massive  
add-on memory.**

Designed as a complete module to fit your Sinclair ZX80 or ZX81, the RAM pack simply plugs into the existing expansion port at the rear of the computer to multiply your data/program storage by 16!

Use it for long and complex programs or as a personal database. Yet it costs as little as half the price of competitive additional memory.

With the RAM pack, you can also run some of the more sophisticated ZX Software – the Business & Household management systems for example.

Designed exclusively for use with the ZX81 (and ZX80 with 8K BASIC ROM), the printer offers full alpha-numerics and highly sophisticated graphics.

A special feature is COPY, which prints out exactly what is on the whole TV screen without the need for further instructions.

At last you can have a hard copy of your program listings – particularly useful when writing or editing programs.

And of course you can print out your results for permanent records or sending to a friend.

Printing speed is 50 characters per second, with 32 characters per line and 9 lines per vertical inch.

The ZX Printer connects to the rear of your computer – using a stackable connector so you can plug in a RAM pack as well. A roll of paper (65 ft long x 4 in wide) is supplied, along with full instructions.

**ORDER FORM: SINCLAIR EQUIPMENT (A'ASIA) P/L**

## Sinclair software on cassette.

The unprecedented popularity of the ZX Series of Sinclair Personal Computers has generated a large volume of programs written by users.

Sinclair has undertaken to publish the most elegant of these on pre-recorded cassettes. Each program is carefully vetted for interest and quality, and then grouped with others to form single-subject cassettes.

Software currently available includes games, junior education, and business/household management systems. You'll receive a Sinclair ZX Software catalogue with your ZX81 - or see our separate advertisement in this magazine.

## The ultimate course in ZX81 BASIC programming.

Some people prefer to learn their programming from books. For them, the ZX81 BASIC manual is ideal.

But many have expressed a preference to learn *on* the machine, *through* the machine. Hence the new cassette-based ZX81 Learning Lab.

The package comprises a 160-page manual and 8 cassettes. 20 programs, each demonstrating a particular aspect of ZX81 programming, are spread over 6 of the cassettes. The other two are blank practice cassettes.

Full details with your Sinclair ZX81.

## If you own a Sinclair ZX80...

The new 8K BASIC ROM used in the Sinclair ZX81 is available to ZX80 owners as a drop-in replacement chip. (Complete with new keyboard template and operating manual.)

With the exception of animated graphics, all the advanced features of the ZX81 are now available on your ZX80 - including the ability to drive the Sinclair ZX Printer.

### Note to Readers

With the continuing introduction of new models and brands of microcomputers to Australia, it is becoming increasingly difficult for APC to cater for each with a particular page or column. And so, for space reasons, it is better that the columns that have been running to date be dispersed throughout APC in Printout, TJ's Workshop, Communication and Programs. Contributors to the machine-based columns should continue to send material to the columns' authors: C/-APC, 462 Burwood Road, Hawthorn, 3122.

Our thanks to the columns' authors for their contributions over the last year.

### 116 ADVERTISERS INDEX:

Who's, what and where.

### 111 COMPETITION WINNERS:

We announce the results of APC's printer competition including the twenty runners up who each receive a year's subscription to APC.

### 86 APC-80:

Ian Davies shows how not to tear your hair out when you've made a syntax error in command mode; for System 80s and TRS-80s.

### 75 V COMPUTERS COMMUNICATE:

This month Steve Leibson looks at Serial I/O, including a description of the industry standard, RS 232.

### 65 HIGH DENSITY VDU CARD:

Our hardware feature for this month: Bruce Hawkins tells how to design and build a display controller to give 80 x 24 character screens.

### 18 A MACHINE FOR ALL SEASONS:

News on Commodore's new computer: The Commodore 64.

### 24 SCREEN PLAY:

Dick Olney reviews games software for the Atari 400. In future issues other popular home computers will be receiving the same attention.

### 31 ADAM OSBORNE:

While in Sydney recently, Adam took time to speak to Graeme Domm in his usual no-holes-barred style.

### 42 ANS BASIC:

The American National Standard for the Basic language contains some powerful and, to those reared on Microsoft products, unfamiliar features. Mike Parr outlines them.

### 44 PATTERNS:

Alan Sutcliffe introduces a novel and powerful algorithm to solve the "hidden surfaces" problem in 3D graphics.

### 49 FRAMES OF REFERENCE:

Continuing Alan Wood's series which explains the facts of micro life to the DP fraternity. This month - how micros should be

introduced into firms which already use mainframes, minis or timesharing.

## REGULARS

### 6 PRINTOUT:

All the micro news that's fit to print plus some that isn't – including details of a new 3" mini disk drive with a ½Mb capacity and news on the First Australian Personal Computer Show – brought to you by Miriam Cosic.

### 38 BACK ISSUES:

Catch up with what you've missed (if we haven't sold out of it).

### 40 NEWCOMERS START HERE:

Our quick intro for those new to computing.

### 57 TJ'S WORKSHOP:

Terminal Junkies get their monthly hardware and software fixes here.

### 73 SUBSCRIPTIONS:

Cut out the monthly sprint to the newsagent's – have APC delivered to your door.

### 80 CALCULATOR CORNER:

Hewlett-Packard announces a new networking system for its programmable calculators and desktop computers, plus some powerful peripherals.

### 82 COMMUNICATION:

Negative and positive feedback from APC's readers.

*Communication*

### 97 USER GROUP INDEX:

Updates and alterations to last month's full listing.

### 97 NETWORK NOTES:

Details of known networks and databases accessible to micro users in Australia.

### 97 DIARY DATA:

A listing of shows, conventions and exhibitions for the coming year.

### 99 PROGRAMS:

More readers' programs for popular machines.

### 113 LAZING AROUND:

After being misplaced last month, JJ Clessa's column is firmly in hand once again.

## BENCHTESTS

### 32 BENCHTEST 1:

David Tebbutt examines the Osborne 01, Adam Osborne's portable micro.

### 89 BENCHTEST 2:

Ian Davies brings the first-ever full test of Applied Technology's Micro Bee.

By now you must be delighted with your Vic 20 and are starting to realise more fully the enormous potential that this product offers. The value of a computer that uses the same micro chip and operating system as a world wide success gives it a range that will be hard to match in a totally new computer. The addition of a colour display makes it a very up-market product right from the start.

We have taken this microcomputer with its power unit, its modulator, decided upon the expansion you would need and condensed it all into an expandable computer system. To allow you sufficient power we have replaced the small power supply with a specially designed power pack. We are giving you a mother board with 7 cartridge expansion sockets.

The cassette port and disc port are still totally usable as are the games paddles etc. Your modulator will now be held at the rear of the expansion board.

We have housed your new computer system including the Vic 20 itself in an aluminium shell. The front of the housing follows the contour of your Vic 20 while the rear is raised to give protection to your cartridges.

As an option we offer an aluminium cover to give greater security and protection, at the same time providing a base for your television. Educational users will no doubt secure this cover to the main shell preventing the removal of cartridges.

The power pack has an extra 24 volt rail and socket at the side of the shell that will power the new Arfon Micro Printer which is being especially designed for our Vic 20 range.

We wish you continued success with your new Vic 20 system and look forward to any correspondence you may like to send to our users group.

From basic unit to basic system with one push.

**APPROVED FOR USE WITH THE VIC 20 COLOUR COMPUTER**

Miriam Cosic and associates report on the latest news from the world micro scene.

# 16-bit battle takes shape

*Two newly released machines are the Canon CX-2 (which was announced last year, and then its Japanese suppliers went very quiet for a long while, because the machine didn't work), and the Sirius 1 (see March Printout).*

There is quite a contrast between these two machines. The Canon uses an uncommon central chip, the Motorola 6809, while the Sirius uses the Intel 8088 (the same as that in IBM's Personal Computer).

It also happens that both chips are half-way between the old eight-bit machines (the Intel 8080 and the Motorola 6800) and the new super-powered 16-bit machines, the Intel 8086 and the Motorola 68000. The main difference is that Intel has gone to the trouble of making sure that users can move from this 'stepping stone' to the big chip (Motorola has not), while Motorola has produced a big chip which is actually several degrees more sophisticated than the old (Intel has not, yet).

So the companies are about level overall, with first the one, then the other having the more modern chip.

On the one hand, anybody prepared to wait a year can get a better chip than is on offer today. On the other hand, anybody who waits a year will have to have something for the rest of us to buy this year, and will want to grab the most effective chip available.

At the moment the 6809 has been available for a lot longer than the Intel 8088, and should logically have sold more chips. Converting systems from the 8080 to the 6809 would have been a hard task, harder than converting to the 8088 (because of XLT-86 which converts 8080 source code to 8088 or 8086 source code). Although Intel produced both 8080 and 8088, and though the numbers are similar, there is no similarity between them. Software which runs on one will not run on the other, and you can't plug the new one into the empty socket on the old boards. Without starting the philosophical argument as to why, it seems certain that people using the 6809 have been less effective in getting products to market than have IBM and Sirius with Intel's 8088.

Canon is a good example of what can go wrong. The machine first appeared with its essential operating software more than a year ago and then could not be released onto the market because that software was faulty.

A year ago, the 6809 was a very powerful micro engine. A machine with that chip plus 128 kbytes of memory was a winner, because it would have twice the internal storage capacity of any 8080-based system, a great deal more processing power and the ability to work on longer words.

It is often suggested that a 16-bit word length isn't significantly more important than an 8-bit one and that what really counts is the program which the chip runs.

This simply isn't true. In a really powerful, comprehensive word and text processing program, the computer has to keep track of simple characters, and keep them in order on the screen, no matter what order they occur inside the computer memory. It also has to keep track of flagposts, such as paragraph indents, special boldface type or underscore words, superscript and subscript notation, and printing commands such as new pages, proportional spacing, and so on. It is also nice to be able

to use the text to index the document automatically. All these things are possible with an 8-bit design, but are far easier, and far quicker, on a 16-bit design.

Even at its simplest, a sixteen-bit code can contain a character and 255 different 'characteristics' such as type face, and so on.

Another advantage of 16-bit engines, frequently overlooked by the 'do we really need them?' brigade, is that most can address vastly more memory than 8-bit machines. You can therefore keep a larger amount of text in memory if you're processing words, which is easier and quicker than shuffling it to and from disk.

The actual power increase of the 6809 over the 8080 and its older brothers can be illustrated by the release last year of the Unix operating system by South West Technical Products. SWTP called it Uniflex (because it differed very slightly from the Bell Telephone original, and for copyright reasons). Uniflex turned out to run acceptably fast, according to experts who were used to Unix.

But it is accepted by most operating system designers that ordinary 8-bit systems would take so long to work their way through the Unix system that they would almost never get round to running any software the user wanted. So, although the 6809 has many characteristics of an 8-bit micro, it also has enough of the nature of a 16-bit machine to run an operating system which was designed for 16-bit Digital Equipment minis.

If the 6809 is to succeed it must appear in sufficient different machines — and those machines must be sold in sufficient numbers, to attract software writers. Software writers are very pragmatic: they use the machine they have in front of them and, if they think they can sell the code they have written they will. But if they find that there are only two or three other users in the country, then they won't bother.

The IBM micro is selling in enormous numbers, and other microcomputers use the same 8088 chip or its big 8086 brother. These are now appearing on the market in twos and threes, and some of

them are already selling in tens and hundreds.

If the Canon had been on the market, actually selling in tens and hundreds, for the last year, there would now be several thousand, all attracting their programmer owners to write code for their colleagues. But it has been under wraps for a year — and now it is neither ultra-modern, nor particularly powerful, nor particularly cheap. A year ago, it was all of these.

All other things being equal, the 6809 chip would, nonetheless, now start appearing in greater numbers than the Intel 8088. However, IBM's choice of the 8088 means that all things are no longer equal, nor is there any chance of their becoming so.

The next chapter, now unfolding before our eyes, is the emergence of the true 16-bit chips, starting with the relatively primitive 8086, and moving up through the Intel family with the iAPX 286.

The difference between the 8086 and the chip inside the 286 processor are enormous, but they don't get in the way of old software. With people moving from the old 8-bit 8080 to the 8088 or 8086, the problem was literally one of translating all the software in the new vocabulary used by the bigger chip. But the 8086, although bigger than the 8088, has the same instruction vocabulary and so does the even more sophisticated iAPX 286, officially announced in February, by Intel.

This processor is not a single chip. It obeys the same instructions, but needs a totally different circuit board to power it up and feed it signals. Having done that, the system builder gets six times the processing speed of the 8086 and 16 times as much memory — 16 megabytes worth — to load programs into. More to the point, programs running in that large block of memory are watched and monitored by the electronics of the processor, rather than having to be monitored by the system builder's own operating system.

The important effect of this is that a user can now look forward to the day when his systems runs two or three

# Looking for .....

**WE ARE HITACHI PEACH DEALERS.**

**WE DON'T SELL OTHER BRANDS.**

more different operating systems — such as CP/M, Unix, Pick and Pascal — simultaneously, without any confusion. And this means that if your word processing package runs under CP/M and you want to link it to a communications package that calls up remote computers automatically under Pascal and pass information to a Unix-based database manager, then this can (theoretically) be done. On the current range of 16-bit micros, it isn't even theoretically possible, because they don't have the iAPX ability to segment its memory, translate program addresses and protect data in the segments.

Motorola, perhaps a bit behind on the 6809 compared to Intel's 8088, has a lead in the true 16-bit market. Its 68000 is now appearing in commercially available systems, culminating in the Radio Shack (Tandy) announcement of an upgrade for its Model II micro, using that chip.

This machine already has the ability to segment and manage its memory — or would have if Motorola could produce more than a few samples of the important memory management chip — and is regarded as more sophisticated than anything Intel can make today, or perhaps for the next year.

However its life is not all mapped out in terms of sweetness and roses, because behind the 68000 there is already a much more powerful 32-bit processor available from National Semiconductor. And several companies now have systems with this 32-bit chip working (in prototype). Zilog's Z8000 family is not much less

sophisticated than Motorola's 68000, and that company is known to be working on the next family too.

Don't do anything so stupid as betting that the 6809 is therefore dead, or at least doomed to the obscurity of technological ideas such as the 72rpm record. But on the other hand, don't bet on seeing more 6809 chips than Intel 8088 ones, either.

## Not so mad Max

Computer Max, who we hope is no relation to Mad Max, has opened up shop in Brookvale, NSW. Capitalising on the fame of electronics king Dick Smith, the company is promoting itself with the line: "You all know (Electronic) Dick, now meet Computer Max."

Ignoring the ribald implications of (Electronic) Dick, all we can say about Max is the new Osborne 1, the Hitachi Peach, Apple and a Toshiba system.

To lure in sales prospects, Max is giving every visitor to the shop the chance to win an Atari 400 micro. Max is at 539 Pittwater Road, Brookvale, NSW (ph: 02 93-1383).

## Apple Logo

When teaching people to program, it's tempting to make it as easy as possible and start with Basic. Not everybody agrees this is a

good idea, because of the habits of thought which get learned (unconsciously) along with that language and which can prevent the programmer from ever becoming as skilful in analysing problems as he might have been, had he learned some other way.

That, at least, is the theory behind the language Logo, which Apple has adopted

'because of the widespread use of Apples in education', said the Logo company, Logo Computer Systems Inc.

The deal between Logo and Apple should bring the language to Australian schools, since Apple now has world-wide distribution rights.

**INTRODUCING  
CALCSTAR.<sup>TM</sup>  
ANOTHER  
INDISPENSABLE  
BUSINESS  
PROGRAM FROM  
MICROPRO,<sup>TM</sup>  
THE WORDSTAR<sup>TM</sup>  
PEOPLE.**

CalcStar software eliminates the need to use ledger paper ever again. It turns your video screen into a "window" on a giant electronic ledger sheet, with up to 600 entries arranged the way you want. Then, by inserting formulas into CalcStar, you create financial models that simulate the future numerically. And predict the outcomes of your business decisions.

When you notice what CalcStar can do for your business, you'll wonder how you ever got along without it. (If you're now a WordStar user, you probably already know the feeling.)

**The MicroPro bonus.** Like WordStar, CalcStar is packed with innovative features that make it versatile and easy to use. Features like Automatic Forms Mode, which lets an inexperienced user enter data into a spread sheet quickly and with less chance of error.

CalcStar's greatest innovation is its ability to join with WordStar. Which means, for example, you can use WordStar's printing options, like boldface and underlining, to dress up financial documents. And you can insert sections of CalcStar's spread sheets into your WordStar documents.

This kind of flexibility should come as no surprise if you're already familiar with the MicroPro software family - a line of programs designed to work together to multiply your problem-solving power. Call or visit our showroom to find out just how big a difference *all* MicroPro products can make in your business. We predict you'll discover it's not just CalcStar or WordStar that's indispensable. It's MicroPro.

Presenting CalcStar - another standard-setting software product in the WordStar tradition.

CalcStar is MicroPro's new electronic spread sheet and financial modeling program - a sophisticated, yet easy to use, calculating and planning tool for all CP/M<sup>®</sup> based computers.

**The ultimate electronic spread sheet.** CalcStar calculates solutions to complex numerical problems in business and finance. Helps you make budget plans and sales forecasts with greater speed and accuracy. And projects figures into the future to answer the "what if" questions you face in business. And CalcStar also has a unique MicroPro advantage: It joins with WordStar to combine spread-sheet and word-processing capabilities in several powerful ways.

**A glance at CalcStar features**

Runs on CP/M version 2.0 or above, with 80-column screen, addressable cursor, and at least 48K memory. 56K or more is recommended for fullest utilization.

Highly user friendly: Call up full screen of help or use help menu. WordStar-like cursor commands User's guide shows you the basics. Install from menu OR a WordStar file.

Stores formulas and formats along with data, for convenience and less chance of error.

Math functions include average, minimum, maximum, logarithms, exponents, and regression analysis.

# MONEY MANAGER

By Andrew P. Bartorillo

**NEW!**

A complete management tool for the home budget, this useful program helps keep track of your income and expenditures and provides an easy method of budget allocation.

MONEY MANAGER answers the question, "Where does it all go?" by categorizing the outgo of your money in accounts that you design according to your needs. It provides a means of keeping complete and accurate records, including an itemization of your tax-deductible expenditures—you can imagine the time savings at tax time alone!

You can store information on up to 100 checkbook entries per month (250 with 48K), specify any automatic withdrawals (such as automatic mortgage payments), keep a separate list of tax-deductibles, and record expenses by category. Checks payable to charge card companies and other lump payments may even be broken up to be placed into the proper individual categories. If you have a lineprinter, MONEY MANAGER will provide formatted printouts by category and time period.

MONEY MANAGER requires a TRS-80\* model I or III with a minimum of 32K and one disk drive. Order this time and money saver now for only \$49.95.

## ACORN PROGRAMS ARE AVAILABLE AT FINE COMPUTER STORES

### LOST COLONY

By David Feitelberg

It's the world's first deep space colony and you are the economic manager. A remarkable simulation, LOST COLONY arms you with maps and charts as tools for resource management. You assign human and robotic labor, explore new land, and set production quotas. At the same time you must determine equitable pay scales and taxes.

Communicate through your model I or III using full sentences or short commands. A challenging game, it might give you insight into real life management as well. Available on 16K tape or 32K disk for only \$24.95 each.

### EVEREST EXPLORER

By William Godwin & Don Knowlton

EVEREST EXPLORER lets you challenge the world's highest mountain without ever leaving home. You make all the decisions in this logistical simulation.

You select the manpower, food, fuel, shelter and oxygen you need. Then manipulate your resources to outwit the elements and terrain, establishing ever higher encampments. Will you reach Everest's 29,028 foot summit—and return to tell about it? Just \$24.95 for model I or III. Order on 16K tape, or the 32K disk version which includes a "save game" feature and other enhancements.

### ASTROBALL

By John Allen

More features, thrills, and sound than even our famous PINBALL. With ASTROBALL in your TRS-80\* model I or III the arrow keys become flipper buttons, the screen becomes the play board, and you become the "Pinball Wizard!"

A flying saucer and moving space-ships add to the fun. Knocking out five meteors earns you an extra ball, while black holes swallow the ball in play. ASTROBALL's five skill levels will have all your family and friends lining up for the pinball action. Available on 16K tape or disk for just \$24.95 each.

## Ohio resolution

High resolution colour graphics are now available for home and business computers of the Ohio Scientific kind.

The Ohio C8P-DF floppy disk video system can be hooked up to a colour television set, and provides 16 colours with a resolution of 512 x 256 points. It has been running in business applications for some months.

Optional facilities include dual sided disk drives, high speed processor and memory, voice output synthesiser, remote control security system for home or business, and assorted research and development boards.

Software includes a variety of standard business packages with word processing, inventory, mailing lists, etc. Nine educational disks cover topics from geography to maths to speech therapy. There are ten games disks, each containing seven games, including star wars, golf and etch-a-sketch.

The C8P-DF operates under two operating systems and responds to Basic and machine language.

Contact the TCG Group, Australian distributors for Ohio Scientific, at head office in Sydney on (02) 439 6477, or in Melbourne on (03) 568 6133.

## With remorse

Having been caught out overdoing the verbal dramatics in this column, I must mention that there is no need to pressure ANZ Books for a copy of Gletzer's *Introduction to Word Processing*. Those estimable dealers have had it all along. It's available from good Australian bookshops for \$17.95 and, if you can't find it, ring ANZ on (02) 452 4411.

## Pearls before swine

A new type of application generator, allowing users with

no computer experience to describe their requirements visually and in English to a microcomputer, is available from Relational Systems International in the US. It's called Personal PEARL, and evolved from the company's earlier software tools. The original program generators were designed to relieve professional programmers of the repetitive aspects of programming.

Personal PEARL enables the arrangement of information in any way needed, and automatically generates applications according to user requirements.

It retails for \$US295 and can be used interchangeably on all micros. RSI can be contacted at 5002 Commercial Street, S.E., Salem, Oregon 97306; Tel: (503) 363 8929.

## Mini mini floppy

A new 3 inch compact floppy disk is available from Japan through Delta. Developed by Hitachi and Matsushita, and manufactured by Hitachi Maxell, the format has been standardised by the three companies to help promote

wide acceptance and use.

Delta will initially and primarily be distributing the little disks for use with their Hitachi computers, though Shugart pin compatibility makes them suitable for other brands.

The disks are plastic cartridges, about cigarette packet sized, with dust excluding stainless steel shutters which pull back on insertion into the drives. (see pic. below)

Recording format, data transfer rate and rotation speed are the same as existing floppies, providing compatibility with ordinary controllers. Because they also have the same recording capacity, data can be retransmitted from the mini to the new compact floppies.

A Write Protect mechanism is available. Storage capacity is 1/2Mb per double density disk. No prices are available at this stage, although it is thought that both drives and disks will be less expensive than normal 5 inch floppy systems now available.

The manufacturers point out, as a feature, that the backbone of the case can be used for titles, but this very thickness also makes them bulky for storage.

According to John Millar, of Delta, the Australian release is two weeks ahead of the

Japanese release and three months ahead of the projected US release. He intends to start shipping 500 units a month.

## VICissitudes

Continuing its habit of tying the underclothes of its dealers into intricate patterns, Commodore has handed the VIC to Dick Smith to be marketed through his chain of shops. Dick Smith is offering his usual seven-day-money-back-if-you're-not-happy deal, plus the three month warranty, plus your name in a barrel for a Datsun Stanza to be given away in November.

Supplies of the VIC are still not flowing freely. While Commodore dealers were apparently mildly surprised that a dealership went to Dick Smith after protestations to the contrary, the expected volume of sales meant that they didn't actually get paranoid about it. However, the fact that a quarter of the initial shipment of 2,000 went to Dick Smith while the old faithfuls have lots of back orders, I'm told, was mildly worrying.

Commodore is also hassling with a delayed reaction from the state governments on certain standards. The standards apparently are not actually being contravened but, in accordance with the axioms of red tape, the fact that there aren't a number of forms in triplicate testifying to it, has brought a freeze six months after the initial go ahead.

## Business contender

Twinlock Australia, with a 15 year history in paper-based systems, has moved into computing with a business system. Based around hardware from Mitsui in Japan, the Twinlock MCS has integrated Australian business software at a very competitive price.

Although developed as a complete business system, Twinlock points out that,

The compact Floppy's size compared with the normal 5 inch disk.

OVER 6,000 SOLD!  
**Australia's most popular computer**  
**DICK SMITH SYSTEM 80**  
 now even better!

**New Model — New Features!**

**WAS \$750 NOW ONLY**

**NEW LOW PRICE**

**\$690**

**All new Expansion Unit — you save!**

A brand new model — now with extra value! The first row of 16K RAM is fitted as standard in this unit, with provision for an extra 16K (which gives the System 80/Expansion Unit 48K total memory). And it's \$100 cheaper than the previous model! It provides as standard, a floppy disk controller capable of controlling up to 4 single density disk drives. Although the exterior of the unit is similar to the previous model, there are significant changes internally; the Centronics printer port is still standard, but the RS 232C interface and connector are now only available as an option. The S-100 motherboard has been removed, and is available as a second option for those who require S-100 expansion capability.

**\$100 less than previous model!**

Cat. X-4020

**\$399**

**NEW LOW PRICES ON PRINTERS!**  
**UNDER \$500 PRINTER!**

Superb dot-matrix printer that uses ordinary fan-fold sprocketed paper up to 204mm wide. Its most unusual feature is the single hammer print-head — this means very few moving parts for increased reliability. Fitted with a standard Centronics type parallel data interface making it compatible with most modern computers.

**WAS \$495!**

**\$399**

**DAISY WHEEL WORD PROCESSOR PRINTER**

The Dick Smith Daisy Wheel printer delivers ultra sharp copy which is a definite prerequisite for word processing. It will accept standard office stationery or continuous stationery up to 400mm wide, if required. The cartridge ribbon and economical Diablo fonts are freely available making this a very versatile printer.

**\$1845 WAS \$1,995!**

Cat. X-3265

**ITOH 8300P DOT MATRIX PRINTER**

The Itoh 8300P features high speed, bi-directional printing (125 characters per second), with full upper and lower case character set. It accepts standard fan-fold sprocketed paper up to 240mm wide. This means you can do 80, 40 or 132 column printing. Fitted with standard Centronics type parallel port. A great seller with great features.

**\$799**

Cat. X-3255

**WAS \$920!**

## and look at this great new software!

### KILLER BEETLES

Pit your skills against the killer beetles. You dig traps and when the beetle falls in you bury him. Problem, they don't stay buried! Cassette based, req. 16K. Cat. X-3598 **\$19.95**

### GHOST HUNTER

The aim is to eat the energy dots in the maze before the ghost can get you. Random 'power pills' will assist you in chasing them. Cassette based, req. 16K. Cat. X-3597 **\$19.95**

### GALAXY INVASION

Real time graphics and sound, the idea is to destroy the invaders and save Earth, but beware of the Flagships! Cat. X-3693 **\$19.50**

### SUPERMAZE

The maze game to end all maze games. It can generate mazes up to 100 x 100 elements — it can take you many hours to find the way out! Cassette based, req. 16K. Cat. X-3672 **\$17.95**

### DEPTH CHARGE

The latest version of the arcade favourite. Your mission is to destroy the enemy submarine pack. Good graphics and includes sound. Cassette based, req. 16K. Cat. X-3686 **\$14.95**

### TREK 78

The classic computer game based on the ever popular TV series 'Star Trek'. This game utilises good graphics and provides continuous 'status' reports. Your aim is to destroy the enemy and save the Galaxy. Cassette based. Cat. X-3644 **\$12.95**

### RAIN ANALYZER

A most useful program for the man on the land, the geography student, etc. By keying rain patterns for your area in the past (these figures normally available at your local post office, etc.) you can predict rain fall patterns, volumes, etc. Cat. X-3767 **\$19.95**

## New! A high resolution Monitor at a low price!

With this monitor added to your computer system, you'll be able to use it for almost limitless applications: for accounts, statistics, education, medical, amusement and for any purpose data and video display. The anti-glare screen with its jitter and ghost free image makes viewing much easier and sharper and allows 80 characters with 24 lines. A must for the serious computer hobbyist or professional. Cat. X-1200

# \$349

## Still cheapest per byte!

These superb disk drives cost so much less than the Tandy disk drives and they incorporate a high-quality MPI B51 drive mechanism together with matching inbuilt 240V power supply!

Each drive has high storage capacity — 40 tracks and is suitable for both single and double density recording.

With double density recording, you can store more than 180K bytes per diskette!

The disk drives are suitable for use with most computers and disk controllers using the standard 34-way connection bus — such as the System 80 and TRS-80 (Don't pay their prices for disk storage!)

**Drive 0**  
Cat. X-4060  
**Drive 1**  
Cat. X-4061

# \$419

**Have you got your copy of our 1982 Catalogue yet? It's crammed full of new products and includes 33 pages of data information. ONLY 75¢**

# DICK SMITH ELECTRONICS

See our Address Page for address details

**NEW** Screen print facility (obtain a print-out of any 'page' appearing on the screen)

**NEW** Built-in speaker

**NEW** Monitor program (suitable for the hobbyist to program in machine language)

Cat. X-4005

## WIN A DATSUN STANZA

When you purchase a VIC-20, System 80 or Sorcerer computer from Dick Smith Electronics you become eligible to win this superb

**DATSUN STANZA**  
GL four door sedan.

So hurry in for your fabulous System 80 NOW!

**HURRY IN NOW!** Not valid in states where this contest may contravene state laws. Permit No. TC.82/27/B issued under the Lotteries and Art Unions Act

*The new MCS computer from Twinlock Australia*

particularly with the amount of internal RAM, the MCS would be suitable for any kind of professional application and for the serious home user.

The system has 128k of internal memory, which is becoming more common on new machines, and the processor is a Z80. The monitor is a Sanyo 12 inch green screen, with an optional colour model available. A high resolution graphics board is being developed. There are two serial ports and a parallel port; and two disk drives provide storage at 330k per drive.

The machine handles CBasic, Fortran, Pascal and Assembly language, and CP/M is on its way.

Australian written and tested software covers the usual range of business applications. PIPS, for Programming and Information Processing,

Simplified, is Twinlock's visicalc-like utility.

The all-up cost is \$6250. This covers the CPU/keyboard, 12 inch VDU, and 8 inch printer which works at 150 characters per second, the disk drives and PIPS.

The company promises full training and support for the product.

Twinlock has branches in all the Eastern states, and is using agents in South and Western Australia. Contact head office in Melbourne on (03) 584 4000.

---

## Tasty new HP

A new desktop computer has been announced to sit at the

top of Hewlett-Packard's 80 series (which began with the HP-85). Called the HP-87, the machine has a considerably more luxurious spec than the other models and comes well supported with scientific, engineering and management software. (Like the 85, the 87 comes with an integral VDU but of larger size and of an unusual landscape format which can handle 80 character displays. The standard memory is 32k RAM, 16k video RAM and a huge 48k extended Basic in ROM. With its normal coyness over hardware HP does not say what processor is used, but memory can be expanded to 544k by add-on modules. Another add-on module contains a separate Z80 to allow CP/M to be run; Wordstar and DBase II are offered along with graphics, maths, circuit analysis and statistics package for starters. A new updated Visicalc which

can exploit the full memory expansion has also been produced.

The extended Basic is upwardly compatible with the 85 version so that 85 programs can be run, and the enhancements include label addressing and indented program listings. An assembler in ROM will soon be available, too.

Disk storage is on standard HP 5in systems or their new winchester drive which holds 5Mb and has a built in 5in floppy for backup. Communications are catered for by HP-IB, RS232 and the new HP-IL loop.

At \$3,595 for the basic computer, the HP-87 sounds uncharacteristically affordable, but the prices of add-on memory and peripherals dispel any vulgar notion that HP is going down-market; the CP/M system costs a bracing \$713.50

# PRINTOUT

Announced at the same time is a new desk-top plotter, the 7470, which sells at \$2,155.74 and can plot in two colours automatically, or more with manual pen changing.

Guy Kewney

## Honeymoon over?

The honeymoon is ending for Digital Research as users get to grips with the new version of CP/M — the one that runs on modern 16-bit micros like the Intel 8086.

Ironically, the serious doubt comes as Digital Research reaches a publicity peak, with first official news leading out (in the computer trade paper, *Computing*) of CP/M for the extremely powerful Motorola micro-processor, the 68000, expected to be universally used in five years time.

The improved 'Super' version of the operating system proved invaluable in getting programs from old 8-bit systems running CP/M, and transferring them to big new 16-bit ones.

But programming companies writing new code for the modern machines — new programs that take advantage of the enormous

See 'Tasty new HP'.

data storage and processing power of the chips — are finding CP/M-86 inadequate.

Peachtree, one of the most successful applications writers (the company claims to be the biggest micro application producer in the world) and with a prestige agreement with IBM to write Official IBM Software for the new IBM Personal Computer, is very dubious about its ability to transfer software, even to a machine like the Sirius.

The reason is that the programmers cannot resist the temptation actually to use the power of the machine.

Normally program writers use all the aids that the operating system can give them — to save them the hard work of writing code to fetch data from disks, to read

keyboards, to display characters on the screen, or to move blocks around memory.

But the old-fashioned options of CP/M, as carried forward into CP/M-86, are just not powerful enough, according to senior programming staff inside Peachtree. And the result is that programs which 'run under CP/M-86' according to the brochure, actually run according to themselves, and merely load under CP/M protocols and commands.

Normally, a dealer who stocks two ordinary CP/M machines will speak confidently about the task of taking a program which runs on one and transferring it across to the other, using a utility program called PIP (or, if it looks difficult, a more

powerful program called BSTAM).

But Peachtree programmers are very dubious about the size of the job facing them in taking programs from the IBM machine (under CP/M-86) and transferring them to the Sirius (and, as yet, unnamed in Australia) even though that has the same processor, obeying the same machine instructions and ostensibly using the same operating system.

They say that there is just too much code written in the base-level language of the machine, which would require programming effort at the level of translate into the alternative version. The version of CP/M for the big Motorola 68000 will have problems that would nor-

# WINCHESTER DRIVE CONTROLLERS — SALES TODAY — SUPPORT TODAY AND TOMORROW FROM AUSTRALIAN COMPUTER & TELECOMMUNICATIONS

## NEED A MICRO-WINCHESTER?

### NEW DAWN

With the entrance of the 5¼ inch Micro Winchesters into the micro and mini-computer marketplace a truly new milestone has been reached. With A.C.T., you can enter this new dawn of micro-computing by providing from 5 to 18 megabytes of Hard Disk storage for your programming needs. If you have been using floppy storage media you can expect your mass media speeds to increase by 25 times not to mention elimination of such irritants as constant changing of floppys, contamination of floppys, etc. MicroWinchesters are the media of the future.

### A.C.T. QUALITY

A.C.T. controllers are field proven. They have been approved and/or used by such companies as Texas Instruments Inc., Litton Industries Inc., Rotating Memory Systems Inc., American Micro Systems, Inc., etc. Since we're an Australian Company we've got to make it right!

### AUSTRALIAN MADE

A.C.T. controllers are made in Australia so there is no need to pay high middle-man profits. And of course, if they are Australian made there is no passing-the-buck on warranty service.

### VERSATILITY

A.C.T. controllers are made to work all popular 5¼ Winchester Hard Disk Drives

even though we can provide you with a Winchester Drive ourselves. The A.C.T. controller will support 5¼ inch drives from 5 to 18 megabytes and comes in two flavours; the dual \$100 card set and the standard 8½ by 9 inch master controller card with separate host interface card.

### COMPATIBILITY

A.C.T. controllers are already interfaced to such popular systems as the Intertec SUPERBRAIN, Heathkit H89/Z89, Tandy TRS80 Model II, Tandy TRS80 Model III, North Star QD, and the very popular industry standard S100. Host interface cards and software drivers for the Apple and Dick Smith systems are to be released soon.

### SOFTWARE

Extensive Hard Disk Diagnostics are provided at NO CHARGE. These diagnostics enable complete testing of the controller and Hard Disk Drive. Run time approximately 30 minutes. Disk editing software is provided at NO CHARGE. FIXDISK is a CP/M\* based program allowing mapping of bad sectors on any CP/M media. A CP/M\* operating system is available for most popular micro-computers, check with us for availability.

### WARRANTIED

A.C.T. controllers are warrantied\*\* for a period of 6 months. Twice that of most hardware vendors.

\* CP/M is a trademark of Digital Research.

\*\* Copies of the exact A.C.T. warantee available upon request.

Please send data on:

- Tandy TRS80 II
- Tandy TRS80 III

mally be expected to be unmanageably more difficult — but will merely be the same problem in a different language. The actual instructions will be different but, more to the point, the machine in which the instructions are carried out will be different but, more to the point, the machine on which the instructions are carried out will be different in its layout, its method of handling messages and of storing data.

What is needed is a new operating system, designed for the big-memory and complex-data abilities of the 16-bit microprocessors, which can run CP/M-86 as one of its sub-tasks the way CP/M runs applications.

And, until someone starts developing the tools that systems designers need for a mammoth task like this, we will have to rely on the normal, slow evolution of complex programs — giving us something useful in five to 10 years from now.

Alternatively, we can wait for results from the colossal sums being poured into Japanese research into the problem of providing these tools.

Guy Kewney

## Superchip

Hewlett Packard has made

another of those announcements whose regularity tend to obscure the ramifications.

The latest "shrinkage" in computer circuitry comes in the form of a quarter-inch chip containing 660,000 transistors. According to HP, it is three times as densely packed as the commercial circuit designs currently available.

Together with the 450,000-transistor chip finished last year and four other chips, the new memory chip forms a complete 32-bit computer system which HP expects to market in a new product in about a year's time.

Geoff Foley, Systems Engineer with HP Australia's Instrument Group, said that the memory chip holds one and a half times the number of parts in a jumbo jet (an interesting but probably useless comparison) and that it holds the largest amount of circuitry ever successfully built into a single chip.

Only 40 millionths of an inch separates the transistors, and this tight packing speeds the system by reducing the distance that electrical signals must travel.

The system can process 32 bits of information simultaneously, and takes 55 billionths of a second to add two numbers.

*Tiny computer chips are bonded to a special copper-core substrate, as shown by this memory subsystem, for higher-performance connections and to aid cooling in a 32-bit processing system being developed by Hewlett-Packard Company.*

Last year one Australian company introduced 209 software programmes to Apple personal computer users and we bet you don't even know our name?

# A MACHINE FOR ALL SEASONS

One of the minor inconveniences of writing for a monthly magazine like *APC* is the time-scale involved in producing the beast. The words you read here were written towards the end of March, yet the mechanics of magazine production dictate that they do not appear until now.

This sometimes makes writing a trifle difficult, for occasionally something happens (or more specifically, looks as though it's about to happen) that is worthy of comment or prognostication at an early stage. By the time the words appear, however, the situation that prompted the prognostication may have changed.

That could well be the case with the first appearance of news about a new machine from dear old Commodore (which has surely been around long enough now to be promoted to Rear Admiral). The machine is called the Commodore 64 and it has been waved around at the Consumer Electronics Show in the USA.

Now the problem is that information on the Commodore 64 — at the time of writing this — is somewhat scant and is likely to stay that way until the Australian launch of the product.

But even that would not be a problem in most normal circumstances, for

Martin Banks  
speculates on the  
impact of  
Commodore's 64.

what information there was available could be ignored until after the event and an article could be prepared then. Indeed, in most normal circumstances that is exactly what would happen. The Commodore 64, however, sounds interesting, both from what the early information suggests the company is trying to achieve and from the viewpoint of the company's products, post Chuck Peddle.

As most readers will by now be aware, the daddy of the Commodore PET, Chuck Peddle, left the company over a year ago to form his own show. That show is Sirius, a company that launched a comprehensive and competitively priced machine at the back end of last year. At the time of that launch, Chuck was questioned about his

view of Commodore now he was outside the company. After all, since the PET, the company had come up with little in the way of internally developed new products. Most of the PET add-ons came from the approved-products scheme and even the VIC had strong Japanese ancestry.

His replies were interesting, especially in the light of recent events, 'Commodore management is primarily interested in shifting product,' Peddle said. He followed that with the prophecy that if the company chooses to stay with its predominantly low-end spectrum, it would continue to be around for a while.

Well, recent developments from the company would tend to indicate that it does indeed intend to stay in the low end of the market place. The more long-term developments that the company appears to be making, moreover, will tend to keep it very much in the business of high volume sales — 'shifting product' as Peddle puts it.

The Commodore 64, on the current sparse information, does not sound spectacular, except for two points. One (almost of necessity) is price. In the US it will retail for \$595 while providing a performance comparable to an Apple II retailing at around \$1650. There is

nothing amazing about that, really, for semiconductor technology is always driving down the price of systems, while maintaining their capabilities, or even pushing them up.

The second point is, in its own way, much more interesting and the previously mentioned comparison with the Apple II becomes more relevant, for the Commodore 64 can run Apple software. OK, so the software will have to be entered via the keyboard rather than

The key appears to be the use of gate arrays — that group of microelectronic devices that allows circuit designers to produce economically a whole range of sexy custom-design devices for whatever they want to achieve. The arrays provide a very useful facility for the system designer who wishes to emulate another machine; for there are several ways of doing this trick, and many problems to be overcome. That facility is convenience.

The two main options facing the designer are : a) use bit-slice processors and microcoding to emulate the instruction set of the emulatee; and b) interface the main system processor with the same system processor as the emulatee. The first route is often the more elegant, and one followed by many of the minicomputer manufacturers to emulate their own products. Its major drawback is that microcoding instruction sets is an extremely complex black-art, and is not really feasible for emulating a range of different machines. The second route is better, because the emulatee processor(s) can be mounted on a circuit board, plugged into the main board of the basic system and away you go. Well, in theory anyway, for the two beasts have to be interfaced, and that means a gate array.

There are many subsidiary problems to be overcome after this decision has been made, and the gate array approach has a part to play here as well. The main problem is where different systems — and especially different operating systems — usually expect to find I/O devices, of different types, at different locations. This means interfacing both at the software protocol level and at the hardware device level. Again, this is the type of application for which gate arrays might have been invented.

It would appear that this is the route that Commodore has selected to follow. The Model 64 would seem to be the basic system for a new range of modular emulators that will almost certainly

Model 64 has 64 kbytes of RAM, it also uses the new MOS technology 6509 processor chip which has on-board memory management that allows up to 256k to be addressed. The processor chip also has on-board RAM, suitable for running a small set of commonly used instructions at high speed. This would be an ideal facility to have for controlling the operation of an add-on emulator board.

As one US stock analyst has already observed, if Commodore actually goes through with what it appears (and is rumoured) to be planning, it could dramatically change the shape of the microcomputer business, for it would have at last brought the hardware side of it down to the level of becoming an irrelevance. Potential users would no longer have to suffer the agonies of choice between rival and incompatible systems — a choice that immediately governs what software can be used.

Microcomputers, or more especially the variety of system emulators, would become akin to commodity items like cans of beans or Intel 8080 processor chips.

Whether this is a good thing for the business in the long term is open to question. The implication of such a move for the hardware companies is that they would all have to follow suit if Commodore's efforts proved successful. Prices would be savaged in an orgy of competition until such time as every potential user in the world was no longer potential — they were actual.

Now if such systems are as reliable as we know microelectronics can make them, all of a sudden the manufacturers' market will disappear. For, apart from anything else, such emulators would essentially mean that any user buying the basic box (say at \$500) plus Apple, Tandy and IBM emulator cards (at \$1000 each) would effectively have the universal system from \$3500.

The only option open to the manufacturers would be, horror of horrors, built-in obsolescence and failure.

There is, of course, a good side to all this. Any degree of universality in hardware, even if it is only achieved indirectly through emulation modules, will allow software writers the opportunity of forgetting about the problem of which machine to write an application for. It will no longer matter too much — and it will also mean that once a program has been written and debugged, it won't have to be rewritten (and re-debugged) to run on another make of system. Universality of hardware will lead to the universality of software, and, as software is the *real* key to everything in this business, that can be no bad thing.

Why the hell should anyone stop at emulating just one type of system — why not the world?

from disk but Commodore reckons the necessary modifications for that function could be provided at negligible cost.

Such 'negligible cost' means that it would be an easy step for Commodore to strike at the very heart of its great US rival, Apple, and produce a low-cost emulator of the Apple II that ran all the software available for the US market leader and that at a price that could seriously damage Apple financially. It is, for example, interesting to note how, since adopting Apple and others as the star stock market purchases of 1981, American stock analysts have rapidly become 'street-wise' enough to notice this possibility from within the Commodore announcement and bomb Apple's stock price by \$2 in a single day.

Commodore apparently says that it has no plans to do that small thing, ever. Instead the company would appear to be after bigger fish. 'Bigger' in this context might sound derogatory towards Apple and as such this is not intended. Rather 'bigger' refers to the whole damned microcomputer business, which now includes some other minor inconsequential companies like IBM.

For Commodore would appear to have latched on to the obvious idea that once you have learned *how* to emulate another type of microcomputer system and found a *way* of achieving the emulation that is both simple and inexpensive, then why the hell should anyone stop at just emulating one type of system? Why not emulate the world — or at least all the relevant bits of it such as Apple, IBM, Tandy, Sharp, NEC or anything else you fancy?

In hardware terms this is now becoming a relatively easy task. Several people in this country have been looking seriously into the possibilities of doing it, and products in this area may well appear in the near future.

Microcomputers ... would become akin to commodity items like a can of beans

cover such systems as the Apple II, TRS-80 and the IBM Thingie. It would also appear that, as might be expected, the cost of each emulator will be fairly low — probably around the \$1000 mark. Each emulator will be a module that plugs into the back of the Model 64 (or a variant/development of that basic machine). No doubt that machine will also have the capability for considerable memory expansion, for though the

# SCREENPLAY

The advances in computer-controlled video games over the past five years or so are breathtaking. A limited number of (mainly textual) computer games had been available to large computer users for many years, but the computing power required prohibited their use by the general public. In the mid-'70s, as the price of components fell and video techniques improved, the first stand-alone video games appeared, seemingly overnight, in arcades and bars throughout the western world. It started with those tennis games, where each player had a flat paddle (sometimes two) with which to return a simple bouncing ball. A slight sophistication of this was the popular 'Breakout', with the ball being used to knock out bricks from a horizontal wall. Then came Space Invaders, which rapidly achieved such notoriety that its name is now often (erroneously) used to describe the entire *genre*.

As Space Invaders and all its descendent forms took over the arcades, the paddle games became available on cheap modules plugging into a domestic TV. For a while, microcomputers could offer only fairly limited textual stuff (like Hangman), but with the advent of cheap graphics they, too, began to run sophisticated and colourful video games. Now the gap between home computers and TV video game modules has started to evaporate and may very soon disappear altogether. After all, if a unit has the power to run complex games programs, why not make that power available to the user?

Over the coming months I shall be looking with a critical eye at the games which home computers have to offer. Although many of the arcade originals like Space Invaders are now available on micros, the arcade games will remain some way ahead of their living room counterparts, if only because it makes sound economic sense for whoever owns the software copyright. For this reason I intend to look also at some of the best of these games.

To begin the series, I have been looking at a wide selection of games for the popular Atari 400, a lightweight home computer designed specifically with games in mind from a well-established leader in this field. The standard 400 carries 16k of RAM and - though it is possible to upgrade this - I have included only those programs which will run on the basic system. Atari ROM packs plug directly into the machine, but for any other games you'll need an Atari 410 cassette recorder. The computer costs \$669, with an extra \$149 for the recorder and \$35.95 for each pair of joysticks (of which at least one is essential), making a total price for the system of around \$843.95.

GAME: Missile Command  
PRICE: \$69.95  
SUPPLIER: Atari

This is one of Atari's most popular arcade games. Your task is to protect six cities from waves of missiles which stream down at you from the top of the screen. You are provided with 30 defence missiles which appear six at a time on your launch pad. The joystick controls a small target sight and leaves a detonation mark when the fire button is pressed, towards which your missiles

are launched. The trick is to place your detonation marks slightly in front of the approaching missiles so that they reach it at the same time as yours do. The game ends when all your cities have been destroyed, though you get a bonus city for every 10,000 points scored. Things are complicated by bombers flying across the screen dropping deadly bombs and by triangular 'smart missiles' which have the ability to avoid your defence detonations.

In the arcade version of Missile Command, you had three bases, each with separate fire buttons and the loss of this feature makes this game rather less interesting, albeit still highly addictive. Options include one or two players (not simultaneously), skipping any number of attack waves (thus starting at a higher skill level), fighting smart missiles only and nullifying the potential for bonus cities. The graphics are excellent, with the colours changing dramatically as you work through the attack waves.

Games like this often attract criticism on the grounds that they represent glorified reconstructions of real warfare. Generally I dismiss this suggestion by viewing the games as pure fantasy having no significant effect upon peoples' actual political attitudes. The military terminology which Atari uses in the Missile Command manual is, however, extremely disturbing. In the introduction you are told that 'For weeks now satellite surveillance has been sending you photographs showing unusual arms buildup. . . It's only a question of time now before the enemy launches ICBMs targeted for the only remaining free cities of the world.' I'm afraid the situation in contemporary America makes it impossible to take such remarks lightly and I wish that Atari had taken a different approach to what should be an entirely frivolous activity. Conclusion - love the game, hate the politics.

GAME: Star Raiders  
PRICE: \$69.95  
SUPPLIER: Atari

Just over five years ago, when I was programming PROM's I used to spend many happy hours playing a game called Star Trek on an Intel development system. In those days colour graphics and real time space games were unheard of, so this game was mainly textual (with some primitive charts) but fairly complex and a lot of fun. Star Trek was very popular at that time, though its delights were enjoyed only by those working in the computer industry. Now Atari has taken this grandfather of games, added some impressive graphics and transformed the battles into fast moving extravaganzas to produce one of the best pieces of games software available.

Star Raiders is a one-player game in which your mission is to destroy all enemy craft (Zylon Starships) before they disintegrate your star bases. The galaxy is divided into sectors on an 8 x 16 grid and the positions of all ships and bases are displayed on your galactic chart. You can move your ship between sectors using 'hyperwarp' and within sectors at any one of nine warp speeds, using the joystick to control direction. The ship's 'on board computer' helps track your prey, which you can then destroy with your photon torpedoes. At the touch of the button your screen can be made to display front and rear view as well as a long-range scan and your ship can be fully protected using shields.

At the beginning of each game you have 9999 energy units, which are used up mostly by movement and firing, though other functions also show a small drain. The game finishes when your ship is destroyed or runs out of energy, or if all your bases fall foul of the Zylon. In addition to this, enemy torpedoes can cause damage to any one of your ship's facilities, thus impairing its functioning. Extra energy can be obtained and repairs

carried out by docking at one of your star bases. There are four skill levels, described as novice, pilot, warrior and commander, which mainly determine the number and efficiency of the Zylon craft. At novice level you do not need to steer your ship in hyperspace, and no damage can be inflicted on your ship (though it will be destroyed if you are hit with shields down).

This game has become almost synonymous with the Atari 400, and deservedly so. The graphics, sound effects and playing functions are all immaculate and combine to produce an intriguing and worthwhile game. If you're on the point of buying an Atari, I would thoroughly recommend that you include Star Raiders in your budget.

USE OF GRAPHICS: \*\*\*\*\*  
PRESENTATION: \*\*\*\*\*  
ADDICTIVE QUALITY: \*\*\*\*\*

GAME: Asteroids  
PRICE: \$69.95  
SUPPLIER: Atari

Asteroids has proved immensely popular in the arcades and, since Atari holds the copyright, this is just like the original. Just in case there's anybody left who hasn't seen it, the game involves eliminating waves of approaching asteroids and the occasional mindless flying saucer by firing missiles from a small triangular spaceship. Moving the joystick right or left rotates the ship clockwise or anticlockwise respectively, and forward gives acceleration (thrust). You can fire continuously, but only four missiles can be on the screen at any one time. Medium and large asteroids

break into two when hit, while the smallest disappear altogether (and yield the most points). Up to four players can take part (assuming you have enough joysticks) and you get various options as to whether players can shoot each other and when the game actually ends. In addition, each ship can choose from any one of three special defences, activated by pulling the joystick towards you. These include impenetrable shields, hyperspace warp (disappearing for a few seconds and moving to an alternative random position on the screen) and 'flip over' (instantly turning your ship through 180°).

Asteroids combines crisp graphics and excellent response time in an exciting and addictive game. If you're into fast-moving space games this is a classic, though perhaps a little dull beside some of the recent games of its genre. It is, however, rather pricey (possibly due to the obscenely large packaging that Atari insists upon, literally 10 times the size of the cartridge it contains).

## General conclusion

The Atari 400 is an excellent games machine with a very large selection of software, of which I have covered only a small portion. Reading cassettes into the machine can be irritating, especially as some suppliers make the lead tape too long, forcing you to search for the beginning of the data on a standard audio cassette player or by trial and error. At present only Atari supplies ROM packs, though I gather Thorn EMI may be producing these soon. The number of Atari software suppliers involves an extensive and varied stock of games which cannot fail to satisfy all tastes. One drawback, however, is the price, which at present is rather too high, though I suspect that Atari (or Futuretronics, the Australian distributors) will soon be forced to review its pricing structure in this country in the face of increasing competition.

## ARCADACE

Inevitably the arcade game I have chosen to kick off with is my personal favourite; the complex 'Defender'. Generally, I begin to lose interest in games soon after my score ceases to improve (though I'm not sure which way this relationship works), but I've found 'Defender' an inexhaustible source of amusement. The playing object looks like a jet fighter and moves both horizontally and vertically. Vertical movement is controlled by a simple two-way joystick, and horizontal movement via a 'thrust button'. There is also a reverse button which turns the craft

round, so you really do have complete control over it. At the bottom of the screen there is an outline of mountains, presumably representing the surface of a planet, but this does not restrict your movement.

The main screen shows only a section of the action and this is complemented by a small scan screen at the top showing the entire playing area. There are ten humanoids scattered around the planet's surface, and your main task is to prevent these being kidnapped by yellow splodges called 'Landers'. The fire button gives a rapid and continuous

beam from the front of your craft and to supplement this you are also supplied with a limited number of 'smart bombs', which kill all aliens on the main screen. The landers try pick up the humanoids and carry them to the top of the screen. If successful, they turn into 'mutants' which give you a lot of trouble. If you shoot a lander while it is attempting this, you can pick up the humanoid and deposit it back on the planet, for which you gain 1000 points. When all the aliens have been destroyed you are given a bonus for remaining humanoids and a fresh attack wave begins.

In the second and subsequent attack waves a varied selection of

aliens is thrown against you. 'Bombers' are little purple squares pursuing a kind of sine wave course in packs of three or more and leaving deadly mines in their wake (luckily these mines are only active for a limited period). 'Pods' are little glistening orbs which, when hit, release a random number of 'swarmers'. The swarmers, as their name suggests, tend to stick together, and are like fast moving orange pips. If you take too long over an attack wave, then 'baiters' appear; they look like little flying saucers and are very difficult to shoot down. I should add that all of these except pods and bombers are constantly firing missiles at you.

If all your humanoids are destroyed (either by landers or your shooting them by mistake) then the planet surface disappears and all landers turn into mutants which mount a concerted and sustained attack on your craft. You start with three ships and three smart bombs and get an extra one of each for every 10,000 points. This means that the game could, theoretically, go on for ever; but in practice the real experts seem to knock up a maximum of around 250,000.

The positioning of the various controls can vary, but usually your left hand controls the joystick and reverse button, whilst your right hand is responsible for the thrust, fire and smart bomb buttons. One other feature is a hyperspace button which randomly transports your ship to a new position in the playing area.

This is fairly hazardous and — partly because the button is out of reach of both hands — I have yet to integrate this function into my game, though many people use it reasonably effectively in cases of extreme panic.

The graphics and sound effects are superb, but the real joy of this game is the extensive control which you have over your ship. The incredibly rapid responses of the machine make for a fast-moving and exciting battle, and the varied nature of the aliens and their modes of attack call for complex tactical manoeuvres. The only drawback to all this is that it takes some time (and a very large number of forty cents) before you really play a satisfying game. I look forward to the time when games of this speed and quality are available on home units.

# OSBORNE IN AUSTRALIA

by GRAEME DOMM

Adam Osborne is not a man concerned with diplomatic niceties. Not content with developing his own unusual micro-computer and undercutting better known rivals in the US, he has made a point of denigrating competitors' products.

Apple, Tandy and other market leaders have borne the brunt of Dr Osborne's criticism of existing micros. Not surprisingly, Dr Osborne exempts his own product from such criticism, saying there is nothing "remotely competitive" against his new Osborne 1 micro.

The modest doctor visited Australia last month to work out arrangements for distribution of the Osborne 1 in Australia. During a busy round of talks, he took time out to discuss the Australian micro market with APC.

"It's a pretty vibrant economy here," he said, adding that the Australian market was "not really" different in other respects from overseas markets.

Asked why he had not tackled the Australian market before, Dr Osborne replied - simply - that he did not have the machines to offer before.

**"If you want to be an entrepreneur you have to be like a good actor."**

He said the Osborne 1 would sell for about \$2200, without a printer. Considering its features, Dr Osborne said this was

excellent value. Asked about criticism of the Osborne 1's small screen size, he had a ready answer: "Anyone who has read a newspaper should have no trouble with our screen." A larger screen was available as a separate unit, but "only about 25 per cent" of customers wanted this.

Following some confusion about who would be selling the Osborne 1 in Australia, Dr Osborne explained that President Computers in Sydney would be selling to the office equipment market, while Computerland would be selling to general users. The Osborne corporation planned to set up an Australian division to service the distributors.

**"We consider the Australian market critically important."**

"We don't want 10 guys all on the street selling our product. We want an orderly market," Dr Osborne explained. Using Australia as a base, Dr Osborne said he expected to be distributing to New Zealand, Indonesia and possibly Thailand by July.

"We consider the Australian market critically important to us," he said.

In countries where the Osborne name is well known, like the US and Britain, the unit is marketed strongly under the Osborne brand. In countries like Australia, where Adam Osborne is known less, the names of distributors are highlighted.

The reason for Dr Osborne's fame is twofold: a book he wrote on microcomputing back in 1975, when the subject was barely known, and a column he wrote for some time in *Interface Age*, a leading micro magazine in America. In his column, Dr Osborne gave annual awards to products or developments he considered promising. In 1977 he gave his award to a newly developed operating system called CP/M. In 1978 he gave his award to an obscure gentleman from an obscure company calling itself Apple. In 1979 Dr Osborne gave his award to a product called Visicalc. Dr Osborne has been unerringly accurate in his predictions for success of products. Whether he will be so accurate with his predictions for the success of the Osborne 1 remains to be seen.

Dr Osborne is originally from Britain, but emigrated to America after graduating in chemical engineering. He gained a Ph.D in chemical engineering at Delaware

University, before working at Shell for some years. Dr Osborne left Shell to take up independent consulting, during which time he developed an interest in the fledgling micro-computer industry.

In 1975 he wrote *An Introduction to Micro-computers*, which exceeded his wildest expectations in sales. From then on, micro-computing was the way to go.

He formed his own book publishing company, which he later sold to McGraw Hill. In 1980 Dr Osborne decided to develop his own micro to cover an area of the market he considered profitable, and in which he believed nobody else was working. The result is the Osborne 1.

Did Dr Osborne ever wonder if his confidence was excessive?

His response was quick: "If you want to be an entrepreneur you have to be like a good actor. You can't be worried about whether you can act. You can afford to make some mistakes, but we have had spectacular growth."

# OSBORNE 01

ADAM OSBORNE'S  
PORTABLE  
WORKHORSE

*When we heard that Adam Osborne was in town and that he had his Osborne 1 computer with him we tracked him down and, hearing that we were prepared to work all night and most of the next day on the evaluation, he kindly handed it over. David Tebbutt takes up the tale.*

Well, after years of telling everyone else what to do and handing out White Elephant Awards to those who satisfied his idea of what is excellent in the microcomputer industry, Adam Osborne has put his neck on the block and come up with an interesting hardware/software package which, with typical modesty, he calls the Osborne 1. It is a portable microcomputer comprising a keyboard, a built-in video monitor, two floppy disk drives and a whole bunch of useful software. In fact, in America, the cost of the software if purchased separately would be around \$1500. The Osborne 1 including all this software sells over there for \$1795, a theoretical hardware cost of just \$295! Nor is the software gratui-

tous rubbish — it comprises CP/M, MBasic, CBasic, Wordstar, Mailmerge and Supercalc. CP/M is just about the industry standard operating system, which means that a wide range of existing and new software products will be quickly made available for the Osborne 1. MBasic and CBasic must be the most widely used Basic implementations; one is interpreted, the other compiled. At the risk of oversimplification, this means that MBasic is easier to use whereas CBasic programs run faster. Wordstar must be one of the best word processing packages around, although my personal preference (bias?) is for Spellbinder, and it comes with Mailmerge, which enables you to maintain and use mailing lists and merge

details from the lists into standard letters and the like. Finally, Supercalc is what the Americans would call an electronic spreadsheet. It allows you to enter numbers, formulae or descriptions on a large matrix of rows and columns. Any cell on the grid whose value is derived from other values within the grid displays a fresh result every time that one of its component values is changed. It is similar to Visicalc but, according to people who've used both, it's also better.

So there you have it; at \$Aust2,200 the Osborne 1 appears to be the answer to every would-be computerist's prayer. It does have one major drawback though — the screen is *very* small — 5in — and that's its *diagonal* measure-

# OSBORNE 01

ment! To overcome this, those who really need one can buy a separate 12in monitor. In America this costs \$250. Of course the machine is then less convenient to carry around. Perhaps the answer is to have the large screen situated wherever you use the machine most.

Adam Osborne neither makes nor sells the Osborne 1. He assembles it and tests it from supplied components and he puts most of the selling emphasis on the software available. In other words he's selling solutions to problems and he couples this with the sinister suggestion that you won't be able to compete in your profession without an Osborne 1. Of course such comments apply to all computers, but to read the sales literature you'd think that the Osborne was the only route to salvation. He even claims that the Osborne 1 marks the advent of the Personal Business Computer. If that's the case, I wonder how he would describe machines like the SuperBrain and Apple.

The Osborne is now available in Australia from several distributors in most capital cities. Adam is only authorising dealers who can demonstrate a willingness and ability to support their customers. This means that you're unlikely to find these machines in discount stores or with flaky dealers.

## Hardware

The Osborne 1 comes in a cream vacuum-formed plastic case with a carrying handle at the back and a keyboard clipped on the front. A groove runs along each side of the case rather like that along the side of some Rover cars. Unlike the cars, this groove makes the Osborne easy to pick up. It's a bit of an odd shape when the keyboard is clamped in place. In fact when you stand it on end the whole thing tilts alarmingly due to the fact that the keyboard unit is designed to slope down towards the user. Although the present case is vacuum-formed, there are plans afoot for a new design using injection-moulded plastic foam. I'll be mentioning that later in the review.

When the machine is opened, you find a black bezel (front) and a grey keyboard set in a black keyplate. The

The O-1 in carrying mode.

The keyboard detaches completely — apart from the ribbon cable, of course.

machine weighs in at 26.5lbs according to my bathroom scales but Adam tells me it should weigh 24. If he's right then my scales are wrong and I'm actually my ideal weight. (*Hysterical laughter — Ed.*) With the keyboard clipped in place the effect is not unlike my wife's sewing machine except of course the O-1 is much lighter.

A disk drive is located on either side of the small 5in monitor and beneath each drive is a pocket capable of holding up to 15 disks. I had a nasty moment during the review when I thought I'd lost all the disks. I searched high and low for them and after 10 minutes of sheer panic I glanced at the machine and there they were, nicely tucked up in one of the pockets!

Along the bezel and below the monitor and disk pockets are a number of sockets and controls. Working from right to left this is what you'll find: battery socket, reset button, external video socket, contrast and brightness controls, keyboard socket, IEEE-488/Centronic parallel socket (software switchable), serial RS232C socket and a modem socket. I quite like the idea of being able to see what you've got plugged into the machine without having to grovel round the back. Quite how it looks when all the various leads are in place I can't imagine. The keyboard lead is a flat cable enclosed in a plastic braid. I presume this is to prevent the wires getting pinched when the keyboard is clamped on the front. I didn't have anything connected anywhere else. The brightness and contrast controls I found essential for getting the display just right; unless it is right it can be very tiring to use. The reset button wipes out the memory and returns you to a monitor command telling you to insert a disk and type RETURN. This then drops you into a master menu or CP/M, depending which disk you've loaded.

The review machine had almost silent Siemens' disk drives. They worked perfectly and I could only really hear them when the house went quiet in the early hours. Around three o'clock in the morning I thought I heard a budgie hopping around — it was the disk drives.

I decided that I'd had enough and grabbed a couple of hours' sleep. MPI drives are installed on some Osbornes and these are just as reliable — the doors are slightly more robust but, according to Osborne they sound like 'a sack of marbles'!

The screen is interesting because it allows two display intensities plus optional underlining. If you're technical you might be wondering how Adam manages this with just eight bits per character. The answer is that he doesn't — he uses nine for the characters to be displayed. Bits 0-6 are used for the ASCII code, bit 7 for underline and bit 8 for intensity. The matrix is an unusual 8 x 10 which gives true descenders, 32 graphics characters plus the underlining mentioned just now. Another fascinating feature of the display is the lateral and vertical scrolling. The vertical didn't work on the review machine, incidentally, so I don't know whether it would be smooth or not. One thing's certain, the lateral scrolling was perfectly smooth. The screen can display 24 lines of 52 characters at a time. The screen memory can hold 32 lines of 128 characters so, using certain control keys, you can move the 'window' to any part of the screen memory. If, for example, you had completely filled the screen memory and you decided to scroll sideways, the effect would be rather like watching a cylinder revolving, because the whole screen scrolls, not just the current line.

The major disadvantage of the screen is that it's too darned small. Adam tells me that he uses it for hours on end without any trouble, though I did ask Adam if he'd considered putting a fresnel lens in front of the screen. He had, and the result was so much distortion that he felt it better to forget it. Here's a money-spinning opportunity for someone — invent a device that fits into one of the diskette pockets when not in use and which magnifies the screen without unacceptable distortion. Of course, if you'd like to make me rich too for tipping you off then that's just fine by me!

The keyboard is nicely laid out, with both typewriter and calculator-

# Convert your Olivetti Electronic Typewriter to a Printer

from \$300

component of your word processing system, producing reliable, high quality, letter perfect printing hour after hour, day after day. Recently, MICRO-80 has expanded its range of interfaces to

include the ET221 typewriter and the revolutionary PRAXIS portable typewriter. Now, no matter which Olivetti electronic daisy wheel typewriter you have, we have an interface to suit it.

The best news of all is that, for the first time, we are releasing our interfaces for direct sale to typewriter owners. Their impressive record of reliability, simple modular design and comprehensive fitting instructions have convinced us that you will be able to fit the interface yourself without hassles and be printing within the hour. This will enable you to take advantage of the highly competitive typewriter market to negotiate the best possible deal from your local distributor then obtain the interface yourself from us. We also offer a fitting service in Adelaide or Melbourne for only \$50.

The best news of all is our low, low prices:

	<u>PRAXIS 30 &amp; 35</u>	<u>ET121</u>	<u>ET221</u>
Prices including			
Sales Tax	\$300	\$375	\$399

Our interfaces provide a Centronics compatible parallel interface. If your computer has an RS232 port then you will also require an RS232/Centronics adaptor available for only \$140 including sales tax.

Interfaces are supplied with power supply, comprehensive fitting instructions and user manual. Cable to connect interface to computer not included in price.

## The Micro-80 Interface.

MICRO-80 has been delivering interfaces to convert Olivetti electronic typewriters to operate as correspondence quality printers for 18 months. Our original parallel interface for the ET121 has been approved by Olivetti Australia and supplied to over 40 Olivetti dealers, plus hundreds of satisfied customers all over Australia, the Pacific region and the United Kingdom. Two of the most valuable features of this interface are its ease of fitting and its extreme reliability. Couple that with its Australian design, manufacture and support and its low price and you know you are getting real value for money. A MICRO-80 interface does not interfere with the normal operation of your typewriter which becomes a versatile

# OSBORNE 01

style keypads. A few things are on the Osborne that you perhaps wouldn't expect on a budget machine — a caps lock and a pimple on the 5 on the numeric keypad so you know where you are without looking. The keys automatically repeat after being laid down for a second or so. My only criticism of the layout is that you need two hands to scroll the screen — one to hold the control key and the other to operate the 'arrow' key. I mentioned this to Adam and he told me that he was faced with the choice of giving the user single-handed cursor movement when creating text or single-handed operation when scrolling (reading) text. At least Adam's way means you can keep your place on an input document with one hand while operating the cursor controls with the other. I wish I'd thought of asking him why the control key wasn't placed next to the arrow keys. Another way of scrolling the screen is to use the control key in conjunction with the 1, 2 or 3 keys. CTRL-1 displays columns 1 to 52, CTRL-2 columns 53 to 104 and CTRL-3 columns 105 back round to 28.

Moving round the back, there's a little recess which contains the on/off switch and a circuit breaker reset button. This is where you stow the cable and plug when carting the machine around. A plastic cover is 'velcroed' over the recess to hold everything in place. Also at the back is the quaintest carrying handle you'd ever see. It's like those leather handles you get on the old-fashioned cardboard suitcases. Adam is a firm believer that if something does a job adequately then that's just fine. To risk boring you with another quote, he says 'Better is the enemy of good, adequacy is sufficient and everything else is irrelevant'. This may explain the 5in screen too and it certainly explains his approach to software authorisation, which you'll be reading about later on.

To get inside the machine it is necessary to remove the bezel, which is attached by four screws, and the brightness and contrast knobs. The screws were easy but the knobs needed a very small Allen key. Once inside, you can only see the first inch or two of the various components since they all disappear into the depths of the case. I felt as if I was peering into a rather full bucket. What I could see looked clean and well made. The only noticeable thing out of place was a jumper wire from one part of the single board computer to another. Adam tells me that there were design faults on some of the earlier boards and that this must have been one of them. The front edge of the board contained all the ports and controls mentioned earlier. Ah yes, that reminds me, the serial port connection should have protruded from the bezel. As it was on the review machine it would have been difficult to attach a printer connector, for example. Once again Adam says that is being attended to. A closer examination would have involved a lot of time literally pulling the machine apart and, really, it just wasn't worth it. I had a peek inside the

keyboard unit and it, too, was well made, comprising a metal keyplate in a vacuum-formed plastic shell. The keyboard itself was quite firm and I noticed that a couple of metal channels ran from end to end underneath. I presume that these were attached for rigidity.

Everything connected with the Osborne 1 has got 'Osborne' plastered all over it, even the disk sleeves. I'm not sure whether this is simply sound publicity or an ego trip by Adam. I must say I find the private man far more pleasant than the public version.

Each disk can hold up to 102,400 bytes of information. That's the equivalent of about three times the length of this Benchtest. The disks are soft sectored with 40 tracks, each comprising 10 sectors. A sector on this machine is 256 bytes. I suspect there must be some sort of software fudge to make CP/M think that the tracks are 20 sectors of 128 bytes. Adam tells me that double-density drives will be available soon, which must be good news for those with high volumes of data to process. Although Adam gets his disks from several sources, he tells me that Dysan is the major supplier. Since I use them exclusively, I was pleased to hear this. I have heard that the oxide coating is less stable on some other disks, the 'no-name' ones being the worst offenders.

## Software

Adam Osborne has collected together a very good range of software which he supplies with the machine at no extra cost. This is sometimes referred to in the trade as 'bundled' software. Adam knew what the most popular applications were and he knew that it would be wise to stick to industry standard system software so he went ahead and wrapped up an entire package which would satisfy most people's immediate requirements and still give them the opportunity to buy other programs as their needs developed. In my view a decent database package would have rounded everything off just nicely but Adam is sticking to a few 'authorised' databases for which the customer pays extra.

Let's comment on each piece of software in turn. If you're an old hand at this game, you'll be able to skip the next four paragraphs without losing too much information.

First of all, CP/M: the name is on everyone's lips, but how many people actually know what it is? The initials stand for Control Program for Microprocessors and it was designed to facilitate the writing of programs for Z80, 8080 and 8085 processors. Although the processors in different microcomputers are the same, the bits and pieces that surround them are very different. Keyboards use different keys, printers vary, screens have different layouts, disks come in an alarming number of shapes and sizes and I/O ports have different addresses. CP/M comes between the program and these different devices and it handles transfers of information between them and the memory. Since CP/M takes care of the information transfer beyond the program and the memory, all the

program has to do is to pass the information to CP/M together with some instruction on what it wants done with it. The program then just sits back and waits for CP/M to tell it that the job's been done. This all means that a program written for use with CP/M rather than for a specific machine will be widely used, provided it's worth using in the first place. All that has to be done to ensure that this will happen is that the machine supplier usually 'configures' CP/M to suit the peculiarities of your piece of equipment. By providing CP/M with the Osborne, a whole world of software opens up immediately.

You also get a few other things with CP/M. You get a whole pile of disk utilities which enable you to format, examine, copy, and generally mess around with information on your disks. The most common uses are to initialise new disks — this means writing the tracks and sectors on them and encoding a certain amount of control information for use by CP/M — and to make back-up copies of files so that you can recover from spilling beer on your master disk, for example. Another useful facility allows you to find out how much space is left on a disk. CP/M is often called an operating system and there are lots of manufacturers around who claim that their operating system is better than CP/M. Better they may be, but the fact is that on 8-bit machines, CP/M is the *de facto* standard and you'd be wise to check the availability of the packages you need before going for a different operating system.

And I've not finished yet. CP/M also includes a couple of programs of great interest to keen programmers, or programmers who want to make their programs run faster. The programs provided are an editor (ED), an assembler (ASM) and a debugging tool (DDT). The editor is an absolute dog and should only be used if you have to create programs in assembler language prior to assembling them into machine code using the assembler. ASM checks your program as it tries to translate it into machine code and if it finds anything wrong it tells you so. It can't detect errors in your program design, only in your coding. Finally, if your program doesn't work as planned then you can use the Dynamic Debugging Tool to examine the contents of various parts of memory and the registers as you step through the program. The assembler and DDT are absolutely fine, but most word

The tiny screen is the O-1's big drawback.

processing packages will allow you to edit program files a darned sight more easily than using ED.

Sticking with system software for the moment, you get CBasic and MBasic with the O-1. There are pretty much the same language except that you can execute one as soon as you've finished typing the program and, if it doesn't work, quickly amend it and have another go. The current buzz-phrase for this approach is 'quick and dirty'. If you write a Basic program using the other version then you have to compile the program using a Basic compiler. This takes longer and you can't really change the code generated by the compiler. You have to go back to your Basic code, change that and then recompile the program. The compilation process is similar to, but not the same as, the assembly process mentioned earlier. Why, you might ask, should you go to all that trouble? The answer is that the resulting program will run faster than an interpreted version and you can also embed identifying information which could trap a copyist because (s)he is most unlikely to find it. I ran the Benchmark programs on MBasic (interpreted) and they were faster than most machines we've tested. CBasic of course would have been faster still. Don't get too excited by these findings unless you are heavily into number crunching. The fact is that, in normal processing, the speed of the machine is completely nullified by the enormous time it takes for the operator to respond to the machine's promptings.

There is another tiny system program tucked in the disk which allows you to enter certain constants from time to time. The first is the speed at which you set the serial port - 300 or 1200 baud. The second allows you to change the screen size - 52, 128 or user-defined. The third allows you to enter the date and time. The time is accurate to within a few minutes per day.

That's taken care of the system programs provided, now let's look at the application programs. First of all, Wordstar and Mailmerge. Wordstar is one of the best word processing packages on the market. On the Osborne it is a little strange to use, mainly because of the small screen - see my earlier comments. Adam has wisely had the package modified so that it automatically scrolls sideways as you are typing text in. He has yet to do that with the Basic packages but he promises me that he will. If you're unfamiliar with word processing there's not a lot I can say here except that it will either increase your throughput of typed material or it will improve the quality of what you write, simply because it is so easy to 'craft' your words until you get them right. If you really want to get into word processing, I suggest you read the April 1981 APC where we ran an introductory article on the subject.

Associated with most of the good word processors is a mailing list facility which enables you to create and maintain a mailing list. Wordstar is no exception to this and it allows you to incorporate names and addresses in documents and letters so that they look as if they were prepared especially for the person receiving them. Lists can be sorted and names and addresses extrac-

ted according to your own chosen criteria. This is all done using the Mailmerge facilities.

Finally we come to Supercalc. You've probably heard of Visicalc, which is one of the biggest-selling microcomputer packages. Well, Adam couldn't get hold of Visicalc for the Osborne I so he decided to plump for Supercalc instead. The program makes good use of the O-1's 'shadow' mode, in which the screen characters can be displayed at half intensity. The spreadsheet grid is displayed in shadow while the entries are all in full intensity. It looks very good. Anyone who messes around with 'what-if' calculations will find this product an absolute boon. Also, are you one of those people who makes lots of calculations and at the end you realise that somewhere, way back, you'd got something wrong which messed up every figure derived since? Using Supercalc, you don't have to worry, you just change the offending number and all the others come right instantly. An interesting bonus is that the data file generated by Supercalc can be edited using Wordstar. I'm sure that's useful but I'm not too sure how useful.

Now on to the ones you pay money for. I mentioned earlier that a database would be my next choice of product. Well, Adam thinks it important too and he recommends three: DBMS, Condor and Datastar. Condor and Datastar are on his approved software list which means that Osborne will be packaging and selling them. DBMS you will have to get direct from your supplier.

Talking of Osborne-approved products, the company will be maintaining three lists: one for the USA, one for the UK and Australia, and an international one. If you're a software writer and you think you'd like to get your product on to the Osborne I then Adam would like to receive your documentation first; then, if he approves, you send him four disks with the program on. It will be carefully examined and any comments made. You will then have to bring it up to the required standard and Osborne will then take over the entire production and marketing effort for the Osborne I version. You just sit back and wait for the royalty cheques to drop through the letterbox. Adam tells me that the royalties start high and reduce as sales increase. His justification for this approach is that the higher the sales the more it is due to the efforts of the Osborne Corporation. In general, Adam is not too interested in 'better' versions of what he's already selling because, apart from anything else, it dissipates the marketing effort and, if the first one was adequate for the job, is it really worth the extra hassle? I'm not sure how he equates that attitude with the fact that he'll be handling two database packages, unless they're very different.

I used almost all of the programs supplied and most of them worked for the limited time I could try them. I did run into trouble once or twice when I keyed something in; it was echoed on the screen but then the most odd things occurred. The only example that I reproduced was that I'd get into MBasic, type AUTO in order to get automatic line numbering and it

*Documentation is of good quality.*

would give me SYNTAX ERROR. I'd try for the third time and it would do what it should have done all along and type 10 on the screen. The problem may be in the MBasic implementation or, more likely, I'd got myself a hardware fault. Adam did say that there were a few problems with the review machine's keyboard. Another problem I had, and this time I think it was the MBasic, was that I couldn't read programs which I'd previously saved using the 'A' suffix. It behaved as if I'd saved a null file. Even CP/M's TYPE command couldn't throw any light on this one. Adam thought I must have had a duff version of the software.

## Documentation

Since Adam Osborne started to make his way in the world with books, you should expect a high standard of documentation. And indeed the manuals are very well presented. Unfortunately the almost obligatory glitches had appeared in the books he supplied me. I don't think I encountered a really serious error - they were things like leaving out the key symbols when describing the various key functions or saying that k=1024 then claiming that the disks were 102k - they're not, they're 100k. When I pointed this out, Adam told me that 'all the manuals are undergoing scrutiny and finalisation right now'. All the books will be in a large paperback format with a glossy cover and very neat, readable typesetting inside. True to form, Adam couldn't resist the occasional homily which I found very refreshing. On the first page of his Users Reference Guide he talked about the incompatibility of the various machines on the market. He then goes on in brackets - well he printed the first bracket anyway - 'This is a deliberate marketing strategy on the part of the manufacturers. It is designed to prevent you shopping around for programs, accessories or additional computers once you've made an initial commitment to one of these products.' Later on he mentions the CP/M editor that I dislike so much 'This editor is primitive and should not be used. Wordstar is capable of perfor-

# OSBORNE 01

ming the same task and is easier to use. If you really must use the editor, consult one of the books now available on CP/M.' Dead right.

Adam has tried very hard to pitch the documentation at the first-time user. In one place he gave the very sensible advice, 'Do not try to get the plastic disk out of the cardboard envelope or you will destroy the disk'. Don't laugh, I've heard of people doing it. Here's another one: 'The door on the drive is closed and opened in the same way as you would open and close an overhead garage door.' Isn't that nice? He's actually remembered his most likely audience, the person who's never used a machine before.

Every package is fully documented, sometimes in the User Reference Guide, otherwise in its own separate manual. The only thing that was missing that interested me was a full technical specification of the Osborne 1. You don't need it to use the machine but it would be of interest to the curious, or to Benchtesters like me. The CP/M overview section of the User Reference book is clearer than most books on the subject although it doesn't try to go too deep with some of the more obscure facilities. I picked up a tip that I suppose I should have realised but didn't — you shouldn't use SAVE more than once since memory contents can be changed as a result of SAVEing.

The MBasic manual has simply been reset because Adam is obliged to retain the original wording until the end of this year. He'll then look at it and change it where necessary. This manual is not at all bad, though, so it shouldn't be a problem. In general, all the documentation will be brought up to the company's house style before publication.

Incidentally, I should give you the address of Osborne Computers: Osborne Computer Corporation, 26500 Corporate Avenue, Hayward, California 94545, telephone (415) 887 8080.

## Users

Who'd use it? My guess is anyone who is taking computing a bit seriously and who either doesn't mind a small screen or who is prepared to forgo a little portability in favour of a separate monitor. The price is good, the facilities offered are more than adequate and, because he's plumped for CP/M, plenty of packages will be quickly available. The sort of dealers that Adam is encouraging are the sort that traditionally sell to the professionals and these are exactly the sort of people that the machine is aimed at. In fact, Adam defines the users as 'professional people using it in the course of their daily work'. It certainly isn't a fun and games machine, although I'm sure that a lot of games will sneak their way onto O-1s. The easiest way for me to describe the market is anyone other than the fun and games, colour and hi-res graphics brigades. I must admit I'm not too sure about number crunching, speed and accuracy either. You'll have to check this out for yourself.

## Prices and delivery

The price we have in Australia is \$2250 including tax for the Osborne 1 with all its standard software (CP/M, CBasic, MBasic, Wordstar, Mailmerge and Supercalc).

The machine comes with a standard composite video output so that any available monitor can be used. At the moment a 90 day warranty is standard for parts and labour.

Until June 30 only two dealers have been appointed: Computerland and President Office Machines outlets. Next financial year several additional dealers are expected to be appointed and Adam sees the establishment of 'Osborne Australia' sometime in July, presumably to oversee his Australian operations.

## Future plans

The machines now being sold here have a new case made of injection-moulded plastic foam in a 'clam shell' arrangement. This means that the inside will be much more accessible for engineers and nosey users. The quaint carrying handle will disappear to be replaced by one moulded into the case. The machine will be lower as a result of having a thinner keyboard unit and it's expected to weigh less. The bezel is expected to be prettier too.

A battery pack is currently under development and the most likely arrangement will be a large flat unit which forms a false bottom to the Osborne 1. Adam expects this to be available by the middle of this year.

Dual-density disk drives should be announced in November or December and communication facilities in six months or so. An 80-column screen with user-defined graphics and a 52-column option is also likely to appear in the near future.

Finally, don't just expect upgrades to be up. Adam is well aware of the potential mass market opportunities for small domestic machines. He hinted at smaller Osbornes as well as bigger ones.

## Conclusion

suppose I've said it all in the Users' section. The machine is well made, offers more facilities than any other machine at the price and suffers one enormous drawback: the screen measures just 5in diagonally. This isn't a problem for occasional use — an hour or two even — but I'd hate to use it continuously. To overcome this problem, a 12in monitor is available and I would suggest that you keep this where you'd use the machine most. Making such a sophisticated machine portable was a really neat idea. I think, though, that there will be a lot of wives up and down the country who'll roundly curse Adam Osborne for what he's done.

Getting the thing going is a doddle — easier than filling a kettle and plugging it in. You'll need a printer — most people I know use the Epson MX-80 and it offers excellent value at far less

than \$1000. Adam Osborne also uses the same printer on his machine, so it would seem ideal. You'll also need disks and stationery to get under way. And then you're in business. I recommend that you consider this machine very seriously among your options.

## Benchmark timings

There is nothing wrong with the Osborne's performance on our standard Benchmarks. It came out faster overall than most other machines we've tested. You must remember though that these tests relate mainly to the computer's numerical processing speed and take no account of accuracy, string handling or disk handling. The other thing to bear in mind is that computers spend most of their time waiting for information to be transferred between themselves and their peripheral devices. Timings were made using MBasic. CBasic would have returned still faster times. All times in seconds.

BM1	1.4
BM2	4.4
BM3	11.7
BM4	11.6
BM5	12.3
BM6	21.9
BM7	34.9
BM8	6.1

## Memory map

0000	System read only space; part switches to ROM in shadow mode
4000	Post processing sequence & data buffer RAM
EA00	CBIOS entry points
F000	Memory-mapped video RAM
FFFF	Top of memory

In shadow mode the memory up to 4000H isn't available when CBIOS is operating. To get into and out of shadow memory mode you need to OUT 0 or 1 coupled with a change to location EF08H making that 0 or 1 too. These routines must be above location 4000H.

## START HERE

*This is our unique quick-reference guide, reprinted every month to help our readers pick their way through the most important pieces of (necessary) jargon found in APC. While it's in no way totally comprehensive, we trust you'll find it a useful introduction.*  
**Happy microcomputing!**

Welcome to the confusing world of the microcomputer. First of all, don't be fooled; there's nothing complicated about this business, it's just that we're surrounded by an immense amount of necessary jargon. Imagine if we had to continually say 'numbering system with a radix of 16 in which the letters A to F represent the values ten to 15' when instead we can simply say 'hex'. No doubt soon many of the words and phrases we are about to explain will eventually fall into common English usage. Until that time, APC will be publishing this guide — every month.

We'll start by considering a microcomputer's functions and then examine the physical components necessary to implement these functions.

The microcomputer is capable of receiving information, processing it, storing the results or sending them somewhere else. All this information is called **data** and it comprises numbers, letters and special symbols which can be read by humans. Although the data is accepted and output by the computer in 'human' form, inside it's a different story — it must be held in the form of an electronic code. This code is called **binary** — a system of numbering which uses only 0s and 1s. Thus in most micros each character, number or symbol is represented by eight binary digits or **bits** as they are called, ranging from 00000000 to 11111111.

To simplify communication between computers, several standard coding systems exist, the most common being **ASCII** (American Standard Code for Information Interchange). As an example of this standard, the number five is represented as 00110101 — complicated for humans, but easy for the computer! This collection of eight bits is called a **byte** and computer freaks who spend a lot of time messing around with bits and bytes use a half-way human representation called **hex**. The hex equivalent of a byte is obtained by giving each half a single character code (0—9, A—F): 0=0000, 1=0001, 2=0010, 3=0011, 4=0100, 5=0101 . . . . E=1110 and F=1111. Our example of 5 is therefore 35 in hex. This makes it easier for humans to handle complicated collections of 0s and 1s. The machine detects these 0s and 1s by recognising different voltage levels.

The computer processes data by reshuffling, performing arithmetic on, or by comparing it with other data. It's the latter function that gives a computer its apparent 'intelligence' — the ability to make decisions and to act upon them. It has to be given a set of rules in order to

do this and, once again, these rules are stored in **memory** as bytes. The rules are called **programs** and while they can be input in binary or hex (**machine code** programming), the usual method is to have a special program which translates English or near-English into machine code. This speeds programming considerably; the nearer the programming language is to English, the faster the programming time. On the other hand, program execution speed tends to be slower.

The most common microcomputer language is **Basic**. Program instructions are typed in at the keyboard, to be coded and stored in the computer's memory. To run such a program the computer uses an **interpreter** which picks up each English-type instruction, translates it into machine code and then feeds it into the **processor** for execution. It has to do this each time the same instruction has to be executed.

Two strange words you will hear in connection with Basic are **PEEK** and **POKE**. They give the programmer access to the memory of the machine. It's possible to read (**PEEK**) the contents of a byte in the computer and to modify a byte (**POKE**).

Moving on to **hardware**, this means the physical components of a computer system as opposed to **software** — the programs needed to make the system work.

At the heart of a microcomputer system is the central processing unit (**CPU**), a single microprocessor chip with supporting devices such as **buffers**, which 'amplify' the CPU's signals for use by other components in the system. The packaged chips are either soldered directly to a printed circuit board (**PCB**) or are mounted in sockets.

In some microcomputers, the entire system is mounted on a single, large, PCB; in others a **bus system** is used, comprising a long PCB holding a number of interconnected sockets. Plugged into these are several smaller PCBs, each with a specific function — for instance, one card would hold the CPU and its support chips. The most widely-used bus system is called the **S100**.

The CPU needs memory in which to keep programs and data. Microcomputers generally have two types of memory, **RAM** (Random Access Memory) and **ROM** (Read Only Memory). The CPU can read information stored in RAM — and also put information into RAM. Two types of RAM exist — **static** and **dynamic**; all you really need know is that dynamic RAM uses less power and is less expensive than static, but it requires additional, complex, circuitry to make it work. Both types

of RAM lose their contents when power is switched off, whereas ROM retains its contents permanently. Not surprisingly, manufacturers often store interpreters and the like in ROM. The CPU can only read the ROM's contents and cannot alter them in any way. You can buy special ROMs called **PROMs** (Programmable ROMs) and **EPROMs** (Erasable PROMs) which can be programmed using a special device; EPROMs can be erased using ultra-violet light.

Because RAM loses its contents when power is switched off, **cassettes** and **floppy disks** are used to save programs and data for later use. Audio-type tape recorders are often used by converting data to a series of audio tones and recording them; later the computer can listen to these same tones and re-convert them into data. Various methods are used for this, so a cassette recorded by one make of computer won't necessarily work on another make. It takes a long time to record and play back information and it's difficult to locate one specific item among a whole mass of information on a cassette; therefore, to overcome these problems, **floppy disks** are used on more sophisticated systems.

A floppy disk is made of thin plastic, coated with a magnetic recording surface rather like that used on tape. The disk, in its protective envelope, is placed in a disk drive which rotates it and moves a **read/write head** across the disk's surface. The disk is divided into concentric rings called **tracks**, each of which is in turn subdivided into **sectors**. Using a program called a **disk operating system**, the computer keeps track of exactly where information is on the disk and it can get to any item of data by moving the head to the appropriate track and then waiting for the right sector to come round. Two methods are used to tell the computer where on a track each sector starts: **soft sectoring** where special signals are recorded on the surface and **hard sectoring** where holes are punched through the disk around the central hole, one per sector.

Half-way between cassettes and disks is the **stringy floppy** — a miniature continuous loop tape cartridge, faster than a cassette but cheaper than a disk system. **Hard disk** systems are also available for micro-computers; they store more information than floppy disks, are more reliable and information can be transferred to and from them much more quickly.

You, the user, must be able to communicate with the computer and the generally accepted minimum for this is the visual display unit (**VDU**), which looks like a TV screen with a typewriter-style keyboard; sometimes these are built into the system, sometimes they're separate. If you want a written record (**hard copy**) of the computer's output, you'll need a **printer**.

The computer can send out and receive information in two forms — **parallel** and **serial**. Parallel input/output (**I/O**) requires a series of wires to connect the computer to another device, such as a printer, and it sends out data a byte at a time, with a separate wire carrying each bit. Serial I/O involves sending data one bit at a time along a single piece of wire, with extra bits added to tell the receiving device when a byte is about to start and when it has finished. The speed that data is transmitted is referred to as the **baud rate** and, very roughly, the baud rate divided by ten equals the number of bytes being sent per second.

To ensure that both receiver and transmitter link up without any electrical horrors, standards exist for serial interfaces; the most common is **RS232** (or **V24**) while, for parallel interfaces to printers, the **Centronics** standard is popular.

Finally, a **modem** connects a computer, via a serial interface, to the telephone system allowing two computers with modems to exchange information. A modem must be wired into the telephone system and you need Telecom's permission; instead you could use an **acoustic coupler**, which has two obscene-looking rubber cups into which the handset fits, and which has no electrical connection with the phone system — Telecom isn't so uppy about the use of these,

# ANS BASIC:

## Mike Parr outlines the unexpected features of American National Standard Basic.

Basic is unusual in that, unlike Fortran, Cobol or Pascal, there has been no realistic standard — the nearest we get is the 'de facto' standard of Microsoft, because it is implemented on many micros. A new standard though, will soon make an appearance; American National Standard Basic, which defines a language of greater power than Microsoft (in the following, I'll use ANS, or simply Basic to stand for the new language).

When I first heard of a new standard, I expected some hat-tipping to Microsoft, ie, a tight definition of Microsoft with additional 'structuring' statements, but this is not the case — the ANS designers have gone for a new language that bears little relationship to Microsoft.

This article will examine the new standard, concentrating on new or different features from what we have come to know as Basic. As the standard is some 200 pages long, you'll be pleased to know that many points are omitted but I trust that the main ideas will come across.

Firstly, the standard is written as a set of modules, not all of which need be present in every implementation. You will always have certain 'core' modules, but may not have those dealing with graphics, enhanced file I/O, or real-time. In practice, though it seems likely that any manufacturer wishing to sell an ANS implementation will (at least) need to implement graphics and enhanced file modules.

### The language

ANS includes much that can be found in traditional Basic. Perhaps a quick way of describing this is to say that it will accept most Microsoft programs that don't use string variables or multi-statement lines. On top of this, variable names can be up to 31 characters long (all significant). Lower-case characters can be used, and variables can be local to sections of a program. The use of numeric variables is conventional in that they aren't declared and are all floating-point. Lines are numbered and may only contain one statement, though a comment may be added at the end of a statement by prefixing it with an exclamation-mark:

```
30K=K+1 ! INCREMENT COUNTER
```

### Control structures

There are two main functions performed by control structures: repetition and selection. For repetition, we have a conventional FOR — NEXT, but also a DO — UNTIL, eg,

```
80 DO UNTIL X>N
90 X=X + 1
100 PRINT X, N
110 LOOP
```

Every structure is delimited by DO and LOOP but we can ring the changes by:

- using WHILE instead of UNTIL
- placing the terminating condition after LOOP
- breaking out of the loop by an EXIT IF statement.

Here's a couple of examples:

```
120 DO
130 X=X + 1
140 LOOP WHILE X<N
```

```
150 DO UNTIL K>10
160 EXIT IF A(K)=0
170 K=K + 1
180 LOOP
```

For selection, we have traditional single-line IF statements, but also multi-line IF. . .END IF and SELECT (case) statements, eg,

```
190 IF X>=0 THEN
200 Y=SQR(X)
210 PRINT Y
220 ELSE
230 PRINT "NO SQUARE ROOT"
240 END IF
250 SELECT AGE
260 CASE<16
270 PRINT "NOT WORKING"
280 CASE 16TO 65
290 PRINT "WORKING"
300 CASE ELSE
310 PRINT "RETIRED"
320 END CASE
```

If you like to design programs with a pseudo-code approach, these control structures should fit the bill.

### Strings

The implementation of strings is radically different from that in Microsoft. Firstly, the maximum string length is implementation-dependent, but must be a minimum of 72. Secondly, the familiar LEFT\$ and RIGHT\$ are replaced by a 'substring qualifier', as in:

```
10 A$="ABCDEFGH"
20 B$=A$(2:5)
```

Here, the bracketed qualifier specifies characters 2 through 5; thus B\$ becomes 'BCDE'. Qualifiers may also appear to the left of an assignment, eg,

```
30 A$(2:3)=A$(4:6)
```

would set positions 2 and 3 of A\$ to 'DEF', resulting in the value 'ADEFDEFG'. To save you the trouble of writing the Microsoft equivalent, it is:

```
30 A$=LEFT$(A$,1) + (MID$(A$,4,3) + RIGHT$(A$,4))
```

ANS also has a concatenation operation '&', together with string functions, the main ones being:

CHR\$(N)	]	character/internal code conversion
ORD\$(X\$)		
LWRC\$(X\$)	]	lower/upper case conversion
UPRC\$(X\$)		
STR\$(N)	]	character/number conversion
VAL(X\$)		
LEN(X\$)		length of a string
POS(X\$, Y\$)		substring search (the Microsoft INSTR)

### Arrays

Surprisingly, only a maximum of two subscripts are allowed, but a number of very useful features exist:

- several matrix functions, eg,  
40 MAT A=INV(B)
- the ability to pass an array of any size to a function, eg,  
50 X=FINDMAX(A())
- a SIZE function to find the maximum allowed subscript, eg,  
60 N=SIZE (A, 2)  
sets N to the largest possible value for the second subscript of array A.
- character string arrays exist as in Microsoft, but ANS allows their use in MAT statements, eg,  
70 MAT A\$=A\$ & "."  
would put '.' at the end of every string element of array A\$.

# IS IT THE ANSWER?

# ANS BASIC

## Segmentation

Together with GOSUB/RETURN, ANS provides three other methods of splitting programs into modules. Firstly, there's a CHAIN statement, which can load and run complete programs — many existing Basic systems have this facility. Secondly, as well as the familiar single-line function definition, we have a multi-line version, as illustrated by:

```
350 DEF BIGGEST (A, B)
360 IF A>=B
370 THEN DEFEXIT BIGGEST=A
380 ELSE DEFEXIT BIGGEST=B
390 END IF
400 END DEF
```

Note DEFEXIT, which returns control to the calling program, with a result assigned to the function name.

We could use such a function by:

```
35 X=BIGGEST (G, SIN(Y))
45 PRINT BIGGEST (K+3, T)
```

Thirdly we have a subprogram, similar in concept to a Pascal procedure, eg,

```
410 DEF SWAP (A, B)
420 TEMP=A
430 A=B
440 B=TEMP
450 END SUB
```

and we could make use of this (to interchange the values of two variables) by:

```
55 CALL SWAP (G, N)
```

Functions and subprograms have facilities for string and array parameters, together with the allocation of local variables each time a module is entered. Among other things, this simplifies the business of writing recursive routines.

At first sight, it may seem that functions and subprograms are very similar, but the crucial difference is in the way parameters are passed: in a function, a copy of the value of a parameter is made available, but in a subprogram a reference (similar to an address) is provided. What this means in practical terms is that given only the copy of a value, a function can't change the original value. However, if a subprogram has a reference to an item (be it an array or simple variable), then its value can be altered.

## Input-output

'Core' ANS Basic has sequential files only, but an interesting feature is the ASK statement, by which a program can make enquiries about a file, eg,

```
500 ASK#3: ACCESS A$
```

This set A\$ to either 'INPUT' or 'OUTPUT', depending on how the file was opened. If you are lucky enough to have Basic with 'enhanced' file facilities, you also get random and indexed-sequential files.

## Graphics

Most languages don't have built-in graphics, hence the incomprehensible use of PEEK/POKE on many Microsoft systems. Let's examine some features of the ANS graphics module.

Assume that we want to plot in a square at the top right of the screen:

In other words, the physical screen ranges from 0 to 600 vertically, and 0 to 1000 horizontally, and we need to select a certain area. In Basic, we do this by —

```
600 SET VIEWPORT 500, 1000, 100, 600
```

in which the order of the values is: left, right, lower, upper. Unfortunately, the coordinates of our square are likely to be unsuitable for our problem so Basic allows us to define a mapping, eg,

```
610 SET WINDOW -100, 100, -100, 100
```

which gives us an origin at the centre, and 100 units in each direction. Once the plotting area is set up, we can use the PLOT statement, eg,

```
620 PLOT X,Y
```

Here, the beam is moved to the position specified by the values of X and Y, and then switched off. To leave the beam on, a semicolon is used, eg,

```
630 PLOT A,B;
```

In one PLOT, we may use several points, so to draw a square: 640 PLOT 0,0; 0,1; 1,1; 1,0; 0,0

Progressing to more advanced features, we can define routines which draw objects (called pictures) and transform them with rotation, scaling and positioning:

```
700 PICTURE SQUARE
```

```
710 PLOT 0,0; 0,1; 1,1; 1,0; 0,0
```

```
720 END PICTURE
```

So, to plot the square we can use:

```
65 PLOT SQUARE
```

and to plot it half-scale and rotated by 45 degrees:

```
75 PLOT SQUARE WITH SCALE(0.5) * ROTATE(45)
```

Finally, in a similar manner to file enquiries, we may ask about facilities:

```
730 ASK VIEWPORT A,B,C, D
```

## Real time

In a real-time system (eg, control of a chemical plant) the computer may have to perform tasks such as:

- examine a thermocouple every second;
- ring a bell every eight hours;
- detect when an alarm button is pressed;
- write some information to disk.

But, at any instant, several such activities may be partially completed: they proceed in parallel and such activities may be defined:

```
800 PARACT WORKSHIFT
```

```
810 WAIT DELAY 8*60*60 ! 8 HOURS
```

```
820 PRINT "SHIFT COMPLETED"
```

```
830 PAREND
```

This activity may be initiated by:

```
85 START WORKSHIFT
```

The result of this WAIT is that execution may proceed to other parts of the program, control only returning to line 820 after the specified delay.

However, there's more to real-time systems than this and Basic also provides for the suspension of activities until events occur, and for passing messages between parallel activities.

## The future

After this quick look at the language, would you want to use it? More precisely, how does it compare with (say) Pascal, Comal, and other Basics?

ANS Basic has very good control structures — better than Pascal — but is weak in the data-structuring area, eg, no records or user-defined types. Also it's insecure compared to Pascal; mis-spelled identifiers may not be detected.

The graphics and real-time modules are attractive and relatively easy to use but ANS will have to stand against competition from existing languages supplemented by systems software (eg, graphics packages, real-time operating systems), or in the future, competition from Ada.

Perhaps it is doomed to be treated as just another Basic dialect, and users will stick to the devil they know — if manufacturers take this attitude, will it ever be implemented?

## Alan Sutcliffe reveals a little known solution to the 'hidden surfaces' problem in graphics.

Representing reality—by which is meant the appearance of things—presents many problems that do not arise in making two-dimensional non-representational patterns. One such problem—or rather a whole group of problems—is to do with the removal of hidden lines and surfaces in showing a three-dimensional scene. What bits of the picture lie behind which other bits and so should not be drawn, or should be drawn and then overwritten by what lies in front of them?

How the problem presents itself and how it can be solved depends a lot on the type of output display used and the way objects are shown. When I did a short animated sequence of an imaginary landscape for the film 'Alien' a few years ago I was able to use a simple approach—there was no time for anything else. A vector graphics device was used, so the scene was made up of a set of straight lines. I chose to show the form of the land by having a series of more or less horizontal lines going across the screen, those further up representing points further away from the viewpoint. Any bump in a line appears as a hill, and any dip as a hollow. Figure 1 shows the method. Each line can only obscure those above (behind) it, and be obscured by those below (in front of) it. Each line represents a horizon up to that level.

The rules for drawing the lines should now be clear, given a set of three-dimensional coordinates for the terrain at a number of grid points, and the position of the viewpoint:

\* Calculate the first, bottom line, and draw it. Nothing is in front of this so it is all visible. It establishes a horizon.

\* Calculate the next line, and determine which parts of it, if any, fall below the horizon: ignore any that do and draw the rest. This establishes a new horizon. Repeat this last step until all the lines are drawn and the scene is complete.

There is an article in the June 1981 issue of *Creative Computing*, reprinted in *Video* in September 1981, that describes the method and the program in detail. The basis is obviously nearest first.

### Hidden surfaces

In a picture composed of areas rather than lines, a similar approach can be used. This is the form most suitable for most micro-systems. Plotting areas rather than lines has one big advantage: it is not necessary to compute just which parts of an area are hidden. If the areas are drawn in the order from furthest first to nearest last the plotting process takes care of this by overwriting any areas that are hidden.

This approach of drawing surfaces in the order of their distance from the point of view is often given as the best,

Fig 1 Simple hidden line: 2 views of the same data.

or even the only, way of solving the hidden surface problem. It is certainly not the only method, and it may not be the best. It has two possible disadvantages.

1. The order in which surfaces are to be plotted depends on the distance from the point of view, and so must be computed afresh for each new viewpoint.

2. The notion of which of two surfaces is nearer to a given point in three dimensions can be ambiguous: a long strip of surface may extend both nearer and further from the viewpoint than a small patch. It is then necessary to go into just which little bit of the long strip is in line with the small patch in the direct line of sight, and then which of these is nearer. That is complicated and time-consuming, and can entail drawing rays out from the viewpoint in all directions to see in which order they skewer the surfaces.

The rest of this article describes a way of dealing with hidden surfaces in which much or even all of the computation about the order of plotting the surfaces is independent of the viewpoint and can be carried out once and for all at the beginning of the program for each fixed scene—say the model of a city—rather than for each different viewpoint in an animated sequence.

This may seem contrary to your intuition—it certainly did to mine when I first found this method—and that may be one reason it does not seem to be much discussed. It is also what makes it particularly interesting. Even in the excellent 'Horizon' programme on American computer graphics shown on TV at Christmas, one of the foremost experts in California said that hidden surface removal depends on distance from the point of view. It does not.

### Assumptions and definitions

This part of the article deals with the background to the method, the theory, while next month I will present a program to implement it on a micro. First there are some assumptions and

definitions to give.

\* Each surface of the scene is flat, and lies entirely in one plane.

\* Each surface may have any shape of outline, and may even have holes in it, like windows in a wall.

\* Each surface is one-sided, that is it has a front and a back and can only be seen from the front.

\* If a surface is wanted that can be seen from both sides, like the inside and outside of a wall, then these sides must appear separately in the catalogue of surfaces: they will differ only in sign, + or -. Often it is enough to keep only the outside surfaces, as in the model of a city where the buildings do not have windows through which the insides can be seen (quite normal in architectural models), and where the city is only to be seen from outside the buildings—the view from inside a windowless block is pretty dull, anyway.

\* The sign of a surface may be thought of as indicating whether it faces towards or away from the origin of the co-ordinate system in which the model is stored. More of that when we come to details of the program.

I must also say a few words about what is *not* being dealt with in this article. Two important aspects are assumed to be dealt with by the program without giving details. They are perspective and 'clipping'—that is, what part of the scene visible from the viewpoint actually falls within the viewing window, assuming that a total 360° panorama is not being presented. These are both matters that depend on the point of view, and I am concerned with what can be sorted out before that is decided.

### A simple example

Here then, is the basis of the method: imagine two surfaces, a patch of ground and a wall nearby but not on the patch. Remember that both surfaces are one-sided and invisible from the back. The underside of the ground can be ignored because we are not going to look at the scene from below ground. So the patch of ground can never obscure any part of the wall. The wall may or may not obscure some part of the patch of ground, depending on which way it is facing. But it will always be safe to draw the ground first and then the wall, and the order of plotting will take care of any part of the patch of ground that is obscured by the wall.

But, you may say, these aren't all the possibilities—because the viewpoint is restricted to above ground. Assume a point of view below ground, then—down a well, for example. From here the patch of ground cannot be seen at all, so there is no question of it obscuring anything. What might obscure the wall is the underside of the ground—a

# NEC PC-8000

## A low cost, high performance microcomputer system designed for your needs..from \$1,500

includes sales tax

PC8000 combines the most wanted features of several leading microcomputers together with a few wonders of its own

Check these features..

- 5 user-programmable function keys. Up to 10 different user-defined routines can be activated using these keys and the shift key.
- 82-key keyboard features function keys and numeric keypad.
- 248-symbol character set.
- Z-80A equivalent microprocessor, running at 4MHz.
- CP/M™ disk operating system compatibility.
- N-key rollover.
- Standard memory features 24K bytes of ROM and 32K bytes or RAM
- 64K RAM is available with the PC-8012AI/O unit.

- 160 x 100 matrix of high resolution graphics, powerful control directly from the keyboard.
- Interfaces include color monitor, monochromatic monitor, audio cassette, Centronics™ printer.
- Screen formats of 20 or 25 lines and 36, 40, 72 or 80 characters per line, with adjustable scrolling window.

- A powerful editor simplifies programming and includes 4-way cursor control, character insert and delete.
- Terminal mode available with a single command.
- I/O unit for plug-in circuit boards.

# PATTERNS

different surface—or more likely the sides of the well. Thus, returning to the wall and patch of ground, the order of plotting them is determined once and for all, for any viewpoint. The steps needed for this simple case are as follows. Make the fixed list Ground, Wall, for all points of view.

As the scene is to be plotted, for each surface in turn and for each point of view, determine if the point of view is in front of the surface, if so draw it, otherwise ignore it.

The distance of the point of view from the wall and ground are not computed or considered at all. The determination of which side of a surface a point is on is simple: put the coordinates of the point in the equation of the surface, and test the sign of the result. For a one-sided surface this must then be multiplied by the sign of the surface, but if the equation is stored in the right form this will all be part of the same step. If the equation of a surface is  $x + 2y + 3z + 4 = 0$ , this can be taken as the equation of the upper surface; while that for the lower surface is simply  $-x - 2y - 3z - 4 = 0$ . The point (1,1,1) for example gives  $1+2+3+4 = 10$ , which is positive when substituted in the first surface, so it is in front of this. In the second equation it gives  $-10$ , and so is behind it.

A zero value would indicate that the point of view was in the same plane as the surface in question, and the convention is that the surface is then invisible, having no thickness. Zero is lumped with negative: in the plane but behind it. But this is taking us too far into the detail of implementing the method before its validity has been established.

## Analysis of cases

In many cases the order in which the surfaces are plotted does not matter at all. Consider a cube which is seen from the outside only. It has 6 one-sided surfaces. There is no point of view from which any of them obscures any other. All they can do is get in front of the backs of some of the other surfaces, but these are invisible anyway. So in a scene consisting of only a single cube the list of surfaces can be in any order. The same is true of any convex object, such as a near-sphere composed of hundreds of small facets each too small to see. Every outside surface is back-to-back with every other outside surface.

If the cube had windows and inside walls, and could be viewed from both

Fig 2 Two areas in the same plane or in parallel planes.

Fig 3 Three cases of areas on intersecting planes.

Fig 4 Four sub cases corresponding to 3 a). Arrow indicates line of sight

Fig 5 Four sub cases corresponding to 3 b).

inside and outside, the situation is not much more complicated. No inside surface can get in front of an outside one, or in front of another inside surface. Each outside surface can obscure some inside surfaces but no outside ones, as noted above. The order of plotting is therefore all (visible) inside surfaces in any order, then all (visible) outside surfaces in any order. Again this applies to any convex body.

For concave bodies and for more complex scenes the situation is more complicated, but in many cases the order of plotting can be decided for all viewpoints. To show this we must abandon this study of particular cases and launch into more basic analysis. This consists of considering in turn all possible relationships between a pair of surfaces. Most of these are straightforward, but there is one set of awkward cases at the end. This is best explained with a set of diagrams in which each of the 2 surfaces is seen end on and so just appears as a line.

A little bit of notation. The two surfaces are A and B.

$A > B$  means that A can obscure B

$A < B$  means that B can obscure A

$A = B$  means that neither can obscure the other.

Now refer to the diagrams in turn.

2a) A and B are in the same plane, so neither can obscure the other:  $A = B$ .

2b) A and B are in parallel planes and face in opposite directions, either both inward or both outwards.  $A = B$ .

2c) A and B are in parallel planes and both face the same way.  $A > B$ .

In the diagrams the convention is that the plain side of the line is the front, visible side of the surface, and the one with the small mark is the back, invisible side.

Fig 6 The awkward case and its resolution

If the surfaces are in skew planes—that is planes that intersect—they do so along a line. There are 3 possible arrangements to consider, shown in Figure 3.

3a) The line of intersection passes through neither surface.

3b) The line of intersection passes through one surface, say B, but not the other.

3c) The line of intersection passes through both A and B. This is the awkward case.

Now we must look at each of these cases in more detail, returning to the edge-on view, looking down the line of intersection of the planes. Figure 4 shows the four sub-cases from 3a and the resulting visibility relation in each case. There is no other way in which two such surfaces can be arranged. Figure 5 shows the detail for 3b, and is again complete. Figure 6 shows the awkward case, and the reason for it is that part of A can obscure B, and part of B can obscure A. Our system breaks down because there is not a single fixed relation between A and B. In fact, this case is a problem for any method, because both relations can hold even from a single viewpoint; plotting A then B may fail, and plotting B then A may fail. The solution, in any method, is to split one of the surfaces into two parts along the line of intersection. This decomposes the case into three surfaces which can be taken in pairs.  $A_1$  and  $A_2$

# ALGORITHMS

are case 2a and so  $A_1 = A_2$ .  $A_1$  and B is case 5d) and so  $B \succ A_1$ .  $A_2$  and B is case 5a) and so  $A_2 \succ B$  (see Figures).

Given this decomposition, we have derived for every pair of surfaces in a scene a single fixed visibility relation which holds for all points of view.

## Graphs and cycles

This is good, but not all we wanted. It is still possible that there are cyclic loops among these relations of the kind  $A \succ B$ ,  $B \succ C$  and  $C \succ A$ , as shown in Figure 7. If there are such loops, then the relation to be used to determine the order of plotting can only be settled when the viewpoint is known. If there are no such loops, then it is possible to draw up a fixed list of plotting order for all viewpoints. In any case it will be possible to draw up a partial list, leaving as little as possible to be decided for each viewpoint.

Thus the next main steps in the process are to convert the data on relations between pairs of surfaces as far as possible into a list of plotting order, that is, until some loop is encountered that cannot be resolved. The way to start this list is to look for two kinds of surface: those that obscure no other surface, and those that are obscured by no other surface. Those of the first kind can be put at the head of the list of plotting order, to be plotted first, while those of the second kind can be put at the bottom of the list. This process can then be repeated and the list built up, from the top down and from the bottom up.

A simple example should make this clear. Consider two vertical square blocks arranged as in the plan view of Figure 8. Forget the tops and bases of these

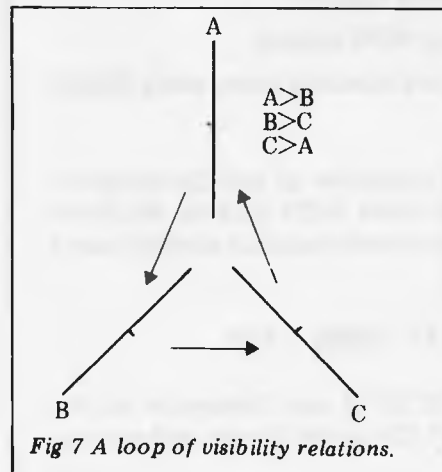

Fig 7 A loop of visibility relations.

Fig 8 Plan of 2 blocks, before and after transfer of the first set of surfaces.

blocks and look only at the sides. Clearly A, B, G and H each have nothing obscuring them, so they may be put at the bottom of the list and plotted last, in any order. Equally C and E obscure nothing and so may be put at the top of the list of plotting order. These surfaces can now be removed from the diagram, leaving only D and F. Neither of these now obscure anything and so they may be put in the middle of the list which is complete:

- C, E
- D, F
- A, B, G, H

If the columns are the same height, the tops and bases can be added to the list with no trouble: they are all in the category of being obscured by nothing and so go on the last line with A, B, G and H. The order of plotting within a line does not matter.

How are these relationships stored and manipulated inside the program? There is a two-dimensional array with an element for each ordered pair of surfaces, where their row and column intersect. Suppose the relations are  $A \succ B$ ,  $A \succ C$ ,  $A \succ D$ ,  $A \succ E$ ,  $B \succ D$ ,  $B \succ E$  and  $C \succ E$ . The array for this data would look like:

		To				
		A	B	C	D	E
From	A		1	1	1	1
	B				1	1
	C					1
	D					
	E					

A helpful way of thinking about this data is as a directed graph. Each surface is represented by a point, and the relation  $A \succ B$  is represented by a line from A to B with an arrow indicating its direction. The same data is shown in this form in Figure 9. Here are the rules for converting this data on relations into a list of plotting order, expressed in terms of the directed graph.

1. A point which has only lines leading to it can be placed at the head of the list—but below any already put at the head—and erased from the graph.
2. A point which only has lines leading from it can similarly be placed at the bottom of the list, but above any already put at the bottom.
3. A point with no lines leading to or from it can be dealt with either as for 1 or for 2 above.

In every case, the point and all the lines connected to it can be removed from the graph when the point is put on the list. This may well bring other points into one of the categories 1, 2 or 3 which can be dealt with even though until this stage they were in the fourth category of having lines leading both to and from them, and so not capable of being transferred to the list under the rules above.

It is this process of peeling off successive layers from the top and bottom that makes it difficult, looking at the data for all but the simplest graphs, to tell whether it is going to be possible to complete the plotting list or whether some loops will turn up to frustrate the process.

## Processing an array

The rules above can be reformulated in terms of the data in an array. Compare

Fig 9 Directed graph representing data in the array.

the array above and figure 9.

1. A point that only has lines leading to it (a surface that obscures no other) has its row blank in the array. D and E in the example.
2. A point that only has lines leading from it (a surface that is obscured by no other) has its column blank in the array. A in the example.

Removing D, E and A from the array leaves only B and C with no line connecting them.

		To	
		B	C
From	B		
	C		

These can be added to the middle of the list completing it:

- D, E
- B, C
- A

The rules can therefore be restated in the following terms.

- Rule 1: Remove from the array any surface with a blank row and put it at the top (inner) of the list.
- Rule 2: Remove from the array any surface that has a blank column and put it at the bottom (inner) of the list.

Any isolated surface with both blank row and column will get dealt with by one of these rules and a third rule for them is not needed.

Continue applying these rules in turn until either all the surfaces have been transferred to the list and none is left in the array, or until all that can be have been transferred and further progress is frustrated by a loop of relations in the array. To recap, the stages in the whole procedure are as follows:

1. Take each pair of surfaces in turn:
  - a) If the plane of each surface cuts the other surface (the awkward case), divide one of the surfaces along the line of intersection.
  - b) When all such divisions have been carried out, for each pair of surfaces determine the visibility relation and record it in the array.
2. Transform the array as far as possible into a list of plotting order. This is a fairly heavy load of computing, but the savings can be considerable over computing the relations and distances for

# PATTERNS

- are needed for each viewpoint.
3. Remove any surfaces from the list not visible from this viewpoint.
4. a) If there are points still left in the array, remove any not visible from this point of view.  
b) For those remaining, transform them using the same rules as before into further items in the list.
5. With the list complete, draw the surfaces in the order of the list. This

order of plotting will take care of what obscures what. That which should be hidden will be hidden and that which should show will show.

Next month I will present the code that implements some of these stages, particularly the part dealing with the conversion of the array into the list, and give an example of its application to a particular set of data representing a small model.

END

each viewpoint. Even if the list can only partially be set up there should be some saving in reducing the work needed for each view. The following further stages

## ATTENTION ALL COMMODORE OWNERS

**PET 2001 Owners:** Having problems increasing your memory? How about giving yourself an extra 8K plus High-Resolution Graphics?

**CBM 3000 Owners:** Would you like full control over a 320 x 200 Dot Matrix display?

**CBM 4000 Owners:** For both small and large screens, you can have 5 extra ROM sockets.

**CBM 8000 Owners:** A powerful Graphics Software Package is included and contains many extra BASIC commands for drawing lines, defining shapes, etc.

The M.T.U. High-Resolution Graphics Package does not affect normal operation of any Commodore. The Hardware is easily installed and the new Graphics Board provides 5 extra ROM sockets, 8K RAM which can be used for program or data storage, over 40 extra BASIC commands and full control over a 320 x 200 Dot Matrix display.

**EXTRA SPECIAL OFFER WHILE CURRENT STOCKS LAST : \$350 + TAX.**

The Commodore VIC 20 Microcomputer is here. Come and see the VIC 20 at our Showroom on the 3rd Floor of 561 Bourke Street, Melbourne. Peruse our wide range of Computer Books and see our Commodore Add-Ons in action.

MICROCOMP are your Commodore experts. We have over 3 YEARS Commodore experience. Even Commodore Australia can't beat that !!!

## A DP MANAGER'S GUIDE TO MICROS

By Alan Wood

All but the smallest companies with no computers are constrained by the systems they have already implemented. A medium-sized organisation with a turnover of \$100 million will have a mainframe for its accounting system, and, perhaps, a mini for order processing and stock control. Large organisations will have a mish-mash of mainframes, minis, data entry systems and, nowadays, some dedicated word processing systems. Both medium and large companies are subscribing to one or more timesharing services. Much of what has taken several years to implement on mainframes may only now be showing a return. The minis in place, typically for interactive order processing, should have provided a quicker payback.

Computer systems in situ and paying for themselves are best left well alone. The better areas for microcomputers are: completely new systems in the office; applications around the inaccessible fringe of big data processing systems; and timesharing replacement tasks. Tackling these areas will be a prelude to more complete distribution of computers to desktops as powerful micros take hold and link into communication networks and big file systems. When planning future strategy for these systems, it is essential to review the current computing constraints and resources of the company. In particular: mainframe computing; minicomputing; timesharing; word and other processing; communications networks; existing computing expertise; and DP policy and company systems.

### Mainframe computing

The introduction of microcomputers into a large company with its own mainframe computer will accelerate some of the trends established when minicomputers were introduced.

Some of the current mainframe tasks can be replaced by microcomputer systems. More frequently, however, the tasks performed on micros will be those that never got high enough on the priority list or simply were not economically justified on mainframes. Consequently, it is expected that microcomputing will result in a better understanding and enthusiasm for computing

## PART 3 MICROS IN MAINFRAME COMPANY

in general, resulting in a growth in demand for all types of computing. Further dispersal of applications on micros can also free mainframes clogged with smaller tasks allowing them to respond better to major company systems.

Mainframe computing will, however, change. Users with limited processing power and storage capacities locally will be seeking to access large central databases. The choice of microcomputer is not significantly affected by the current mainframe, but the choice of mainframe applications will be affected by the increasing capability of microcomputers. The strategy established for mainframe computing should be reviewed so that a general computing strategy to meet future company needs reflects the capabilities and costs of micro technology.

Gradually the incumbent mainframe

manufacturers are being forced to come up with their answer to the ubiquitous microcomputer. Of the mainframe suppliers, IBM and ICL have already produced some reply and Univac, Honeywell and the others cannot be too far away — unless they are totally deaf to the strident calls of the new technology. So far, IBM's Personal Computer offers nothing new except the IBM label on an Intel chip and industry standard software, the acknowledgement of which is the most significant feature of IBM's micro. IBM has clearly understood the trends and requirements and, given this reading and the IBM name, it is bound to sell in volume. But IBM has not provided an easy, answer for computing management. It has only produced a personal computer, the lowest animal in the micro world, and there is no sign yet of a powerful multi-user micro and no local area network. It seems unlikely that either of these products will be seen for some time, if they ever appear at all. Powerful micro systems would seriously undermine IBM's existing product line and it has not tooled up to provide early and much cheaper replacement products.

### Minicomputing

Much of the comment on mainframe computing applies also to minicomputing. Smaller minis will be replaced with large micros, much as large 'minis' have come to replace older mainframes. Micros are rapidly becoming more powerful, and the overlap with small minis is already significant. Expertise gained in minicomputing is directly applicable to large microcomputers. The term 'micro' and 'mini' will become less significant. Intel has already introduced the term 'mainframemicro' with the launch of its 32-bit, 3-chip processor. The 16-bit 'minimicros' will be soon as

# FRAMES OF REFERENCE

commonplace as PETs and Apples — indeed those machines are soon to have 16-bit processors of their own.

The mini manufacturers, already showing a reduction in growth compared to the breakneck pace of the '70s, are beginning to respond with their micro offerings. Some have read the market well, while others have made the mistakes evident in some mainframe suppliers. DEC has had a micro, the LSI 11, for as long as anyone. The range based on this chip has been very successful, right up to the PDP 11/23 multi-user system. Data General also had the MicroNova for some while. Both the DEC and Data General micros are old 16-bit technology — not as compact, as cheap or nearly as powerful as the new 16-bit chips which are now displacing them.

Data General will shortly be moving into the Desktop micro market with a relaunch of the MicroNova in new packaging, the Enterprise. It has laboured for over two years to bring the machine to market with its own software, while the market has been rapidly moving away from it to industry standard software. DG seems to have misread microcomputing as badly as it completely missed the word processing and office automation market into which Wang rocketed. Hewlett-Packard, on the other hand, seems all set to provide a full line from the personal computer with industry standard software, the HP125, right up to its big mainframe replacement machines. The HP125 provides the very successful industry standard operating system, CP/M, over 100 CP/M packages and Visicalc. Endorsement by HP and IBMs of the independent software producers is the equivalent of hi-fi manufacturers making sure pop records can be played on their machines.

## Timesharing

The displacement of timesharing services is one of the most rewarding applications for microcomputers. As more packages become available on more powerful micros, this trend will accelerate. Financial modelling, linear programming and PERT are three common applications for today's micros.

Many timesharing systems are personal systems, involving a large amount of interaction with the user. Such applications are ideally suited to a microcomputer. Microcomputer solutions will usually be cheaper, will give a faster, less frustrating response and will allow the user total control over his system. A local microcomputer can also be used to access the wealth of programs and databases on timesharing machines, thus extending the use of the facility. The programming skills required to develop microcomputer systems are similar to those for timesharing systems, ie, programming in Basic, APL and Fortran.

A number of timesharing companies have already started to offer micro front ends to their services. They are recognising the inevitable — if you can't beat them you'd best join them. The microcomputer can cut down the cost

of data entry on timesharing services, as well as providing local computing capability off-line for word and numeric processing. The 16-bit micros are complete replacement machines for all but the highly specialised number crunching and big database timesharing services. With one megabyte of 16-bit RAM and a 10 MHz processor, you can perform some vast calculations and, since it will not cost you in connect or CPU time, you can always leave your desktop mini-micro on all night to perform heavy-weight jobs.

## Word and other processing

Many people are using micros as word processing machines. Others purchase dedicated, purpose-built word processors, which in any case are based on micro chips. In the near future they will require both types of machine to communicate with each other as part of an electronic mail system. Viewdata services are gradually gaining ground as information providers to the larger company. Yet again, the ubiquitous microcomputer can be used as a viewdata terminal by plugging in the appropriate software and hardware. Word processing on microcomputers is not as simple or as sophisticated as on dedicated word processors. Sophistication is not so important since, as on fancy calculators, the clever features that sell the machine are seldom used. The simplicity factor is important, especially if you are dealing with typing pool word processing. WordStar, the most popular word-processor on CP/M micros, is not 'user friendly' compared to the dedicated word processor. WordStar will work on a standard VDU and can be configured to run on all the popular makes of VDU. This means that the same VDU can be used for standard data processing and the normal cursor control features are available to the programmer. But it also means that the commands appear on the screen and there are no one-step function keys as with the dedicated word processor. Because of the popularity of the WordStar, VDU suppliers are now producing WordStar options on their keyboards to make the package simpler and quicker to use.

There is no simple rule-of-thumb for choosing between a dedicated and a microcomputer word processor. If the application is 75 per cent word processing, you will be better off with a dedicated machine. If the application is part data processing and part word processing, a microcomputer is the solution. However, if you look at the office of tomorrow linked into computing and communications, general purpose microcomputers are likely to provide more flexibility. For example, a two-station microcomputer could service an executive and secretary, where the one is performing financial planning, the other word processing and both are sharing an electronic filing cabinet. The combination of information management with numeric word processing is becoming increasingly common. On the same station, the office team could also link

into private viewdata and have a main-frame connection. Recognising these trends, Wang has recently put the CP/M operating system on the Wangwriter to provide access to the CP/M software bank. Digital Research has also implemented CP/M on the IBM Displaywriter (available only in the US and Canada at the moment).

## Communications network

The demands of all the new computing are going to overburden existing communication networks. The requirements for voice, fax, video and data transmission both within buildings and to and from remote locations are creating demands for much more sophisticated and much faster communications channels. Micros are just adding to the load and bringing the demands forward by placing computers in the hands of more and more users who want to communicate with one another. A variety of architectures is being developed to meet these demands, one of the most significant in microcomputing being local area networks.

Like microcomputers themselves, local networks vary enormously in sophistication. The simplest provide a means of slaving a number of micros off a master machine and sharing data storage. A second level provides fast site communications and the capability to string hundreds of devices around a building, effectively replacing the multi-user minicomputer. At a higher level still come those universal networking and data management systems which provide for the intermixing and interchange of data between otherwise incompatible mainframes, minis, word-processors, micros and other digital devices.

## Existing computing expertise

This is the most important current resource to consider. Computer departments have established a wealth of expertise over the years and it is a considerable company asset. Much of what has been learnt in mainframe and minicomputing is valid for microcomputing, although the better computer departments question the relevance of this experience to the latest technology. Skills must be updated on micros, and additional expertise in hardware engineering should be added. But computer departments can become better equipped to support microcomputing than any other department. In establishing a rationale for microcomputing, it will be especially important to consider existing software skills and programming languages.

New computing is changing the role of management service and computer managers. More and more they have to function as consultants and contract negotiators, steering the organisation through the maze of technology and buying in most of the software and complete systems needed to satisfy their requirements. The job is becoming less a line management, recruitment and staff motivation function and more a super-

consultant and purchasing management position. The trend began with mini-computers and is accelerated by micro technology. Some of the actions which flow from the changes are to: ensure you have a consulting function available to your department; design a software strategy that takes advantage of packages from software manufacturers on mainframes, minis and micros; develop and disperse in the direction of software availability and suitability; buy in turnkey systems rather than build new technology teams; and pursue self-education with a technology update and training in purchasing as a minimum.

## DP policy

The introduction and application of microcomputers should fit within a revised DP policy which relates current and future technology to the present and future needs of the organisation.

It is important to draw a clear distinction between company systems — those that are integral to the company's business — and personal systems — those that are peculiar to one or more individuals. For example, micros have been very successfully deployed for goods receiving, warehouse stock location local stock control, and branch information processing. These are all company systems, frequently with multiple sites. They must be controlled from a central point. Time-sharing replacement systems — modelling, for example — are often personal systems, an extension to an individual's skill. If the individual leaves the company, his successor may employ different techniques to achieve the same results. Personal systems should be approached with the same passion for central control associated with company systems. A very fruitful route for future planning is the development of company packages on micros that can be used on many sites. Company packages can greatly increase efficiency, keep development costs down and avoid re-invention of solutions to the same problems. Provided as turnkey systems to users, they are one pointer to the future role of data processing departments.

## Other factors

When developing a strategy for micro-computing, each organisation should establish a list of significant factors affecting such a policy.

1. Company environment: As well as computing resources and constraints, there are company constraints; the implementation of microcomputing has to take into account the company environment. The nature of the business is clearly important; for example, a manufacturing business has different microcomputing requirements from those of a service industry.

## The American Educational Tour

Every computer professional should spend 3-4 weeks on a technology update. This tour should concentrate on:

1. Your mainframe supplier's future developments and timing.
2. The leading mini suppliers: DEC, Hewlett Packard, Wang.
3. A semiconductor manufacturer: Intel.
4. The technology universities: Stanford, MIT.
5. The software manufacturers: Digital Research, Microsoft, MSA.
6. New architecture companies: Tandem, 3 Com, Xerox.
7. Exhibitions: Comdex: NCC, West Coast Computer Faire.
8. Random trips in Silicon Valley to recommended sites.

The company structure has a strong influence on the manner in which micro-computers are introduced and should be carefully considered. It is vital that control of microcomputing be situated at the right place in the company structure. The new technology will have a profound effect on the company as a whole and the computer department in particular. Important changes of this nature invariably lead to problems of internal politics with different departments seeking control. Microcomputing will have a strong influence on future company policies for several aspects of the company's business. For example, it is likely that turnkey micro systems will lead to staff retraining and redeployment. The planning of future staffing must be integral to the introduction of new technology. Like other computer systems before them, micros are at their best and are most frequently used in areas where business is expanding. Put in the hands of interested users, the new technology will create a base of new products and services as well as improve productivity.

2. Users' attitude towards DP: It would be unrealistic to assume that all users are favourably disposed towards DP departments. Disappointments with previous computing, frustrations over delays and costs, and naivety about computing generally, allied to continual press and TV bombardment about the micro revolution, will lead some users to seek their own solutions which can be expensive to the company as a whole. The establishment and promotion of a professional microcomputer service by DP departments will go a long way towards ensuring that the optimum use is made of microcomputer technology. DP departments should be aware that many user managers will have budget authority to spend the capital sums to acquire a micro, as will engineers, technicians and scientists. It will not usually be possible for DP to establish a monopoly on micro supply and application. However, the need for advice and support services from DP will grow and an increase in user independence should encourage healthy mutual respect. It is vital that DP gears up to provide a rapid response to user needs, especially through purchase of

turnkey systems. Response times normally associated with mainframe systems (six to 18 months) will frustrate users further and understandably encourage them to seek satisfaction elsewhere.

3. Software and services: While hardware costs continue to fall, manpower costs are rising with inflation. Increasingly, software development and services will represent the highest cost in a total system. But the naive user does not understand software and relates cost to hardware prices. In microcomputing, software and associated services are rarely less than the hardware and frequently three times more than the hardware cost. It is vital to tap available expertise, using good development aids and packages wherever possible. Computer departments have a very important role to play in protecting users and the company from making expensive software mistakes.

4. Security of suppliers: The micro industry is young and volatile. The first microcomputers came on the market in 1975. Some companies have become established in sectors of the market, a few have come and gone already. There is no one dominant manufacturer: no IBM or DEC. However, there is much more software and hardware conformity in microcomputing than in mainframe and mini computing because the industry is a component industry. The common international hardware and software standards should be adopted. They will provide independence from any one supplier and give a wide range of choice in products.

5. Maintenance and day-to-day operation: In looking at any new development in computing, the promise of the technology frequently overshadows the more mundane but vital aspect of reliability, maintenance and day-to-day operation. DP departments are well equipped to advise their users on the importance of these aspects since they apply equally in micro-computing as to mainframe and minis. An important element in choosing equipment is the availability of maintenance and spare parts. Equipment which is supported under complete system maintenance contracts by established companies is advised.

6. Component industry: As already mentioned, the microcomputer industry is predominantly a component industry. This has developed partly by chance and partly by necessity. Most of the manufacturers started off in a small way. Some significant companies today, e.g. Apple, started in someone's garage only a few years ago. Many were hobbyists and technicians who obtained relatively modest private

## Micro Options to Conventional Systems

1. Systems economically justifiable on new low cost technology.
2. Systems with data volumes in the 100k — 100M range.
3. Terminal systems with stand alone capability.
4. Systems with 1-16 users.
5. Local area network replacement for minis.
6. Timesharing replacement for numeric applications.
7. Mixed processing systems, data, information and word processing.

## A feast of computing ideas.

## You'll love every byte.

If you work with a 6502 or 6809 based system, you're probably hungry for the facts and ideas that will help you understand the inner workings of your computer. You want to go beyond canned software—use your computer for more than games—learn the advanced programming techniques that enable you to get the most out of your 6502/6809 system.

**MICRO, The 6502/6809 Journal**, gives you page after page, month after month, of solid information to sink your teeth into. **MICRO** is the premier how-to magazine for serious users of the Apple, PET/CBM, OSI, Atari, AIM, SYM, KIM, and all 6809 based systems including the TRS-80 Color Computer. It's a resource journal internationally respected by professionals in business, industry, and education.

**SUBSCRIPTION RATES (U.S. dollars)**  
 Yearly subscription (ISSN 027-9002) saves 20% off the single-issue price.  
 U.S., \$24 (SPECIAL OFFER: Save 30% off single-issue price: 2 years, \$42)  
 Other countries, \$27 (via surface mail. Foreign air rates available on request.)

## Get more out of your Apple . . .

with the **MICRO ON THE APPLE** series

### VOLUME 2 just released!

More than 40 new programs on diskette to help you get more from your Apple:

- Machine Language Aids
- I/O Enhancements
- Runtime Utilities
- Graphics and Games
- Hardware and Reference Information

**31 choice articles**

**46 tested programs on diskette** (13 sector DOS 3.2 format)

Volume 1 also available at \$24.95.

Together **MICRO on the Apple 1 & 2** provide more than 70 programs on diskette for less than \$1.00 each. No need to type in hundreds of lines of code.

with the most important book ever published for the Apple

The most comprehensive description of Apple II firmware and hardware ever published—all in one place.

### What's Where in the Apple?

● Guides you—with a numerical Atlas and an alphabetical Gazetteer—to over **2,000** memory locations of **PEEKs**, **POKEs** and **CALLs**.

● Gives names and locations of various **Monitor**, **DOS**, **Integer BASIC**, and **Applesoft** routines—and tells you what they're used for.

● Helps BASIC users to speed up their programs.

● Enables assembly language programmers to simplify coding and interfacing.

All Apple users will find this book helpful in understanding their machine, and essential for mastering it!

# Here's to a longer life!

This is new Verbatim Datalife™. Both 8" and mini flexible disks with 7 data-shielding improvements for a longer lifetime of trouble-free data recording, storage and retrieval than ever before possible.

All to assure users throughout the world the best possible performance, time after time, for a long, long time to come.

Users in Australia get

an added benefit, because Verbatim Datalife disks are being made right here.

So now you won't have to wait for deliveries coming from afar. And you can have technical support that's nearer, getting you responses faster.

Verbatim Datalife

disks. The best flexible disks made in the world, now being made right here.

Support your local disk.

Available through

**magmedia**. Contact them at (02) 428-1100, (03) 699-9688, (07) 229-1941 or (062) 48-6751.

# FRAMES OF REFERENCE

financial backing to produce specialist printed circuit boards. Other private companies went into business putting these boards together to form microcomputers. Even at chip level, it is a component industry with board manufacturers using a selection of chips from a variety of manufacturers. Through necessity, hardware standards developed and the industry is growing into adulthood. The flexibility, robustness and economies of scale resulting from a component industry with good hardware standards has resulted in a healthy industry in which non-component companies are less competitive. Micro companies are still relatively small and some will undoubtedly go out of business. When selecting microcomputers it is therefore essential to carefully consider the financial standing and reputation of the manufacturer. It is also necessary to buy in expertise because front-line support is limited in comparison with that provided by mainframe and mini manufacturers.

7. Communications and policy for convergence: Communication is a subject frequently raised in the same breath as microcomputing, especially in large companies with dispersed computing facilities. Today it is practical to use a microcomputer as a terminal and to transfer files from one microcomputer to another. A number of communications software manufacturers have emerged and IBM 2780/3780 and 3270 protocols are generally available to turn Z80 microcomputers into very cheap emulators. Emulation software for other popular machines is arriving on the market, and some users will develop their own emulators for distributed micro systems with mainframe connections. However, microcomputers are justified most frequently as linkless terminals where communication is not required or where a postal floppy disk service is perfectly adequate. There is a growing demand for a means of interconnecting not simply micros and minis but other devices, e.g. word processors, photocopiers and viewdata services. It is important that the impact of these demands on existing communication networks is considered and a strategy to meet future requirements established.

8. Future technologies: Microcomputer technology is changing rapidly. Companies will often wish to take advantage of the latest technology but should be careful about pioneering new products in operational systems. Continuously keeping near the forefront of technology can be costly if it means replacing equipment every year and expanding the range of supported systems. It is possible to adopt new technologies inexpensively by using relatively well-proven products. The position of microcomputing a year ago was that there were proven, operational, single-user systems performing calculations and data processing tasks. Today there are proven multi-user systems with substantial cheap storage and communications capability. In a year's time proven technology will be available to facilitate the convergence of disparate computer architecture and the exchange of data between many different devices. The gateway to these technologies is in standard software, CP/M, MP/M, Unix, MBasic, CIS-Cobol and Pascal — a point that is repeated to ensure that the software media is the message.

Provided they are identified as prototypes, a valuable contribution can be made from experimental systems, and large departments should have a research and development budget to test new products. Communication and convergence products can be taken on now in controlled experiments which can add considerably to subsequent computing capability and economics.

## Summary of possibilities

A later chapter explores the applications for the general-purpose microcomputer but a summary at this stage will help put this powerful and versatile machine into the context of existing computer resources and constraints.

1. Options to mainframe systems.

- Low priority systems: Systems not economically justified on mainframes and/or those that never appear high enough on the priority list to be implemented.

- Replacement of creaking systems that need major overhaul.

- Low data volume systems. Systems with file sizes from 100k to 100Mb.
- Terminal systems with stand-alone capability. Systems primarily used for local processing with occasional need to access/update mainframe files.

- Extensions of big systems to lower levels in the company, eg, depot stock recording.

2. Options to minicomputer systems.

- Similar options to mainframe systems.

- More affordable 'minicomputer' Systems with 2-16 users.

- Local area network alternative to multi-user minis.

3. Options to timesharing systems

- Replacement of numeric applications, financial planning, PERT.

- Replacement of lower data volume systems.

- Use as data entry devices to cut connect costs.

- Terminal systems with stand-alone capability.

- Local area network with timesharing capability.

4. Options to word processing and other systems.

- Alternative to dedicated word processors.

- Suited to combined data processing and word processing applications.

- Alternative to dedicated viewdata terminals.

- Local area networks with electronic mail capability.

5. Relevance of existing expertise.

- User timesharing skills apply, eg, Basic, APL, Fortran.

- DP development skills apply, eg, ANSII Cobol availability.

## The third commandment of microcomputing

Thou shalt not be inhibited by the limitations of today's microcomputers. Even as they are being discussed, the inadequacies of the current generation of microcomputers are being made good in subsequent generations. The summary of possibilities describes some options created by today's 8-bit and 16-bit machines. The emergence of commercially available 32-bit devices in two years' time will dramatically enhance the application of micro technology, especially as it combines with new video, communications and storage technologies. Companies planning a five-year computing strategy must be aware of those possibilities and make decisions that will provide a pathway from 8-bit to 16-bit to 32-bit machines. It is essential for management to investigate developments in the different fields of computing.

Management service executives should spend several weeks in the USA visiting leading semiconductor, mainframe, mini, micro, peripheral, communication system and software suppliers. Such a trip will be a revelation: no words can have the impact of actually seeing the new products that the microchip is siring. The sophistication of the products and the speed with which factories mushroom to produce them is stunning even for those close to the technology.

# TJ's WORKSHOP

Our monthly pot-pourri of hardware and software tips for the popular micros. If you have a favourite tip to pass on, send it to: 'TJ's Workshop', APC, 462 Burwood Road, Hawthorn, 3122. Please keep your contributions as concise as possible. We will pay \$10 for any tips we publish (think how much solder and/or sticky tape that would buy).

## TRS-80 4k TO 16k UPGRADE

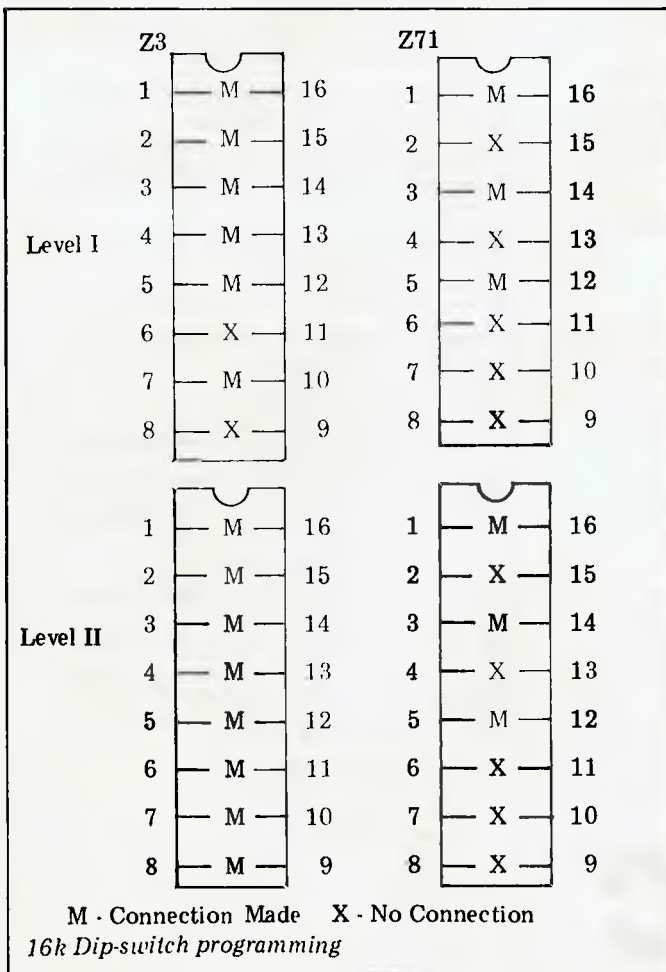

One of the most overpriced items in computing at present must be the 'official' Tandy 4k to 16k keyboard memory upgrade for the TRS-80 Model I which costs approximately \$250 at any Tandy store. Following the instructions below, the expansion can be completed, without soldering, for a cost of approximately \$20 to \$24. The parts required are:  
8 x 4116, 200 ns memory chips  
2 x 8 way DIL switches

The expansion is carried out as follows:  
1. Ensure that the power is turned off, and remove all cables from the back of the TRS-80. Turn the keyboard upside down and remove the six screws, noting their different sizes to enable correct re-assembly. (NB: The removal of these screws will void the Tandy 90 day warranty.)  
2. Find the eight chips, which are socketed, and identified as Z13 to Z20 on the circuit board. Before

these chips are removed, note the position of the notch at the end to ensure that the eight new chips are inserted the correct way around. Remove the old chips and insert the new ones, taking care not to bend any of the pins.  
3. To enable the computer to recognise the new memory, changes must be made to the programming of the two DIP shunts located at Z3 and Z71 on the circuit board (they are clearly marked). Looking at the circuit board with the reset switch at the top right, the two DIP shunts should be removed and replaced with the DIL

switches, programmed as shown in the diagram.  
4. After double-checking that there are no bent pins on the newly inserted chips; and that Z3 and Z71 are correctly programmed, replace the back of the TRS-80 keyboard, connect the cables, and turn on the power. Type "PRINT MEM" in command mode. The reply should be 15572 if you have an old ROM level II (MEMORY SIZE?) CPU like mine. I believe that the reply should be 15570 for the new ROM level II (MEM SIZE?) and 15871 if you have a level I machine.

L. Trigg

'It's either an elaborate hoax or they were more advanced than we thought.'

**B**usiness is a serious game. Winning takes a lot of hard work, and the ability to make the right decisions in any situation. The more tools you have to make these decisions, the greater your success. SuperCalc is the planning tool you need to make better use of your time and energy, having a direct positive effect on your bottom line.

SuperCalc finally makes it possible for decision makers to manipulate data quickly, setting up exactly what is necessary for in-depth analysis and modeling. It all takes place on the SuperCalc spreadsheet simulator screen. You can examine and alter numbers and text within a grid that can cover up to 63 columns and 254 rows of data.

## THE SUPER FEATURES OF SUPERCALC.™

Accountants, planners, engineers, and business owners have found SuperCalc invaluable for day-to-day "what if" questions, as well as "now what?" for those times when the unexpected occurs. All it takes is a second to enter the new figure in the appropriate column, and SuperCalc automatically calculates the rest of the spreadsheet. And, you certainly don't need a programmer—SuperCalc really is easy to use. It's been designed to use the minimum number of commands to get the maximum power, and it's self-explanatory: just press the ? key if you need assistance.

Another feature that makes SuperCalc special is the error message display. Previous planning products "beep" the user when a mistake is made, without telling the user what the mistake is. SuperCalc won't put you through the humiliation of trying to figure out where you went wrong. Instead, down in the lower right corner of your screen you'll see a message that lets you know where the error occurred. So you can immediately correct it and proceed with your analysis.

You can produce a report from your spreadsheet simply by activating the output command sequence. Other packages require a completely different program to accomplish this. And, you can combine portions of other spreadsheets previously created, to build a completely new spreadsheet. All of this happens in seconds; SuperCalc is as fast as it is workable.

Pencils, paper, and a calculator have been replaced. SuperCalc and your CP/M computer are now the tools of the successful decision maker.

# SuperCalc™

### ANY SQUARE ON THE GRID IS YOURS TO

**MANIPULATE.** An active cell is one in which you're working at any given time. The cursor moves from one cell to another as you desire.

### MEMORY SPACE LEFT IS INDICATED.

SuperCalc will let you know how much room you have for everything, so you'll never run out of room in the middle of a project.

### HOW WIDE ARE YOUR COLUMNS? YOU

**DECIDE.** Each column can be a different width if you wish. That's flexibility for beautiful reports.

**CURSORS MOVE FAST.** Press a direction key on your keyboard, and the cursor moves—fast. Hitting the return key keeps the cursor moving in whatever direction you have specified with the arrow, so you can quickly locate the figures you want to manipulate.

### ALL COMMANDS ARE PRINTED OUT FOR YOU.

All the commands you need to operate SuperCalc are printed out when you press the command key.

**MOVE WHEREVER YOU WANT.** You can specify where you want the cursor to be, by typing in the location. For example, if you wanted to be in column C, row 5, you'd type C5. Easy.

**QUESTIONS GET ANSWERED.** Whenever you run into a problem, or forget a command, you don't have to go far for help. Simply press the question mark key. On your screen will appear the command list, so you can press the right key and move on instantly.

### WHERE'S THE BOTTOM

SuperCalc always tells you the exact location of the bottom, left-hand corner cell for the entire spreadsheet. Handy for combining spreadsheets for printing reports.

### CURRENT CELL'S CONTENTS AND FORMULA OR VALUE ALWAYS DISPLAYED.

Wherever your cursor is, you'll be able to see the entire text line. Or, if you're using a formula, it will be displayed also. You're always in control with SuperCalc, because you're fully informed.

**TWO WINDOWS AT ONCE.** You can combine any section of your spreadsheet with any other section. You can even combine two different spreadsheets! You can move the cursor to the other window at will.

### SUPERCALC TOP LEVEL COMMANDS

B(lank).....> Empties cells.  
C(opy).....> Copies cells.  
D(elete).....> Deletes rows or columns.  
E(dit).....> Allows editing of a cell.  
F(ormat).....> Changes format: cells, rows, entire worksheet.  
G(lobal).....> Makes one command universal.  
I(nsert).....> Creates new row or column.  
L(oad).....> Reads all or part of worksheet from disk.  
M(ove).....> Swaps rows or columns.  
O(utput).....> Displays or prints reports.  
P(rotect).....> Prevents future alteration of cells.  
Q(uit).....> Exits SuperCalc.  
R(eplicate).....> Reproduces parts of rows or columns.  
S(ave).....> Stores worksheet on disk.  
T(itle).....> Locks first rows or columns in place.  
U(nprotect).....> Allows changes in protected cells.  
W(indow).....> Splits or unsplit the screen.  
Z(ap).....> Clears worksheet.

## ZX81 TIPS 1

Machine code users might like to know that you can reset RAMTOP without clearing the memory (useful if you suddenly remember you haven't reserved enough space). Method is as follows: POKE desired value for RAMTOP into 16388 and 9; PRINT USR 1040. It's as simple as that. Any Basic program remains unaffected, though variables are cleared.

Replace bulky IF statements used to control printing with one line as follows:

```
10 IF X=1 THEN PRINT 'YES'
20 IF X=0 THEN PRINT 'NO'
30 IF Y=D THEN PRINT 'FALSE'
40 IF S<>F THEN PRINT 'TRUE'
```

becomes:

```
10 PRINT 'YES' AND (X=1);
'NO' AND (X=0), 'FALSE' AND
(Y=D), 'TRUE' AND (S<>F)
```

Unfortunately, even if the third condition is not fulfilled the two commas are still acted upon, so you have to

watch line spacing. This can be a terrific memory saving.

Why not structured Basic on a ZX81? Simply identify program areas with REM statements (you do anyway, don't you?), giving each area a name. Declare that name as a variable at the beginning of the program with a value equal to the line number following the REM statement in which it occurs. Then, in your GOTOs, specify the variable name. This also makes simple renumbering routines which cannot cope with GOTOs more useful. After renumbering the lines you have only to check the REM statements to see what new values have to be assigned to the variables; no need to keep a record of where lines specified by GOTOs have been moved to. An end to incomprehensible GOTOs?

David Lawrence

## ZX81 TIPS 2

I have noticed a few useful features of the ZX81 logical operator set. In addition to the standard functions (AND, OR, NOT), relational operators are valid boolean operators. This is because the logical result of a comparison is one or zero, instead of true and false, ie, PRINT A=B is a valid expression. This has useful implications when modelling combinational logic systems.

ZX logic is defined in Figure 1. Care must be taken when mixing arithmetic operators (+,\*) with standard logical

operators (AND, OR, NOT) as the latter have much lower priority when the expression is evaluated, so application of brackets is essential. In fact, the only use for AND and OR as standard functions is the mixed type expression, ie, A\$AND B will return string A\$ if A is true. Full truth tables for a switching function can easily be generated thus as in Figure 2. (note I=one):

Try expression  
A<>(B<>(C<>D)) - 4-bit  
parity generation!  
David Davies

Figure 1

ZX notation	Boolean expression	
A<B	$\bar{A}.B$	(NOT A) AND B
A>B	$A.\bar{B}$	(A AND (NOT B))
A<=B	$\bar{A}+B$	(NOT A) OR B
A>=B	$A+\bar{B}$	A OR (NOT B)
A<>B	$A\oplus B$	A EXOR B
A=B	$A\odot B$	A EXNOR B
A*B	A.B	A AND B
A+B	A+B	A OR B

Arithmetic operators work too!

Figure 2

```
100 FOR A=0 TO 1
110 FOR B=0 TO 1
120 FOR C=0 TO 1
" " " "
260 FOR Z=0 TO 1
270 PRINT A;B;C;...Z;"; (SOME EXPRESSION.)
280 NEXT Z
290 NEXT Y
" " " "
530 NEXT A
```

## EPROM PROGRAMMER FOR PET

An EPROM programmer is out of my price range, especially when I only want an occasional 2716 programmed; also as a hobbyist felt I should do as much as possible myself, even if it took a long time — that's part of the enjoyment.

The current 'standard' EPROM is the 2716: it costs around \$10, but will doubtless cost half that by the time this article is published. It holds 2048 bytes of memory. It has 11 address pins, eight data pins and five others:

- Vcc : 5 volts
- Ground : 0 volts
- Vpp : 26 volts when programming, 0 or 5 volts when reading
- OE : needs Vcc when programming, 0 volts when reading
- CE/PGM : requires a 50 millisecond pulse of Vcc when programming and 0 volts enables the 2716 when reading.

To program the first address of the EPROM we do the following:

- 1 apply 25 volts to pin 21 (Vpp);
- 2 apply 5 volts to pin 20 (OE);
- 3 apply the address to the address pins (1-8, 22-23 & 19);
- 4 apply the data required to the data pins (9-11 and 13-16);
- 5 apply a 50 millisecond TTL high-level pulse to pin 18. (CE/PGM).

To program the next memory we now increment the address in 3 above, change the data, and then send another program pulse.

When all 2048 bytes of data have been programmed, we switch off the 5 volts to pin 18 and then the 25 volts to pin 21. It is important to do the switching in this order. Vpp should only be switched

when CE is at ground potential. It is also important that the program pulse be fairly accurate. If it exceeds 55 milliseconds damage will almost certainly be done to the EPROM.

Of the PET's output ports the Parallel User Port (PUP) is the most useful. It has the data bus available — for both input and output — and the CB2 output for control. I wanted two other outputs so I spent some time studying the IEEE port. In the past I have treated this with great suspicion, but after some experimentation (not to mention several frustrating crashes) I obtained two outputs that could be programmed fairly easily. These were from pins 6 and 8 (DAV and NDAC), which can be addressed in machine code within \$E821 and \$E823.

The provision of addresses for the 2716 is straightforward. Three SN749s will give 12 addresses — one more than needed — with only two inputs to think about: one to zero the counters and another to increment them one at a time.

Basic is too slow and unreliable for times as short as 50 milliseconds so the programming and checking of the EPROM is done entirely with machine code. The Basic program (shown in Figure 1) which leads to it is merely a print-out program which slows me down, forcing a 'Y E S' from me when I have done various things in the right order. The machine-code program is shown in Figure 2.

During the programming of the 2716 there is a need for four states. A SN7474 is used to latch these states according to the following truth table:

Figure 1

```
LIST
100 PRINT "2716 EPROMMER"
110 PRINT "-----"
120 PRINT "MEMORY FOR ROM MUST BE PLACED BETWEEN"
130 PRINT "S0C00 AND $13FF BEFORE RUNNING THIS"
140 PRINT "PROGRAM ANY FURTHER. IF THIS IS OK"
150 PRINT "PLEASE WRITE":CHR$(34);"Y E S";CHR$(34);":":GOSUB2000
160 PRINT "PIN 20 (OE) SHOULD NOW BE AT 0 VOLTS"
170 PRINT "AGREE? (Y E S)":GOSUB2000
180 PRINT "PLEASE APPLY 25 VOLTS TO PIN 21(VPP)"
190 PRINT "DONE? (YES)":GOSUB2000
200 PRINT "PLEASE APPLY 5 VOLTS TO PIN 20(OE)"
210 PRINT "DONE? (YES)":GOSUB2000

we check that the memory in RAM coincides with its equivalent in the ROM. Any failures cause the appropriate error message to appear on the screen.

It is not necessary to program all 2 kilobytes at any one time. By altering the LDY at \$0A99 and the LDAs at \$0A90 and \$0A9F you can program fewer amounts of 256 bytes, or start programming from a higher address than \$0C00.

When the 2716 is new (or newly-erased) it is full of '1's (16,384 of them). It is programmed by converting some of these '1's to '0's. It is therefore important that all locations between \$0C00 and \$13FF, other than those which contain data to be transferred, contain \$FF.

Programming mistakes are fairly easily rectified with the help of a sun-ray lamp if you don't have access to a proper eraser. 25 minutes within 3in of a glowing ultra-violet bulb make the EPROM as good as new. But be careful which way round you insert the chip — the sun-ray lamp doesn't correct for 25 volt mistakes! You will find that Data 1 on pin 9 doesn't read '0's ever again if you try to program the 2716 with it inserted back to front.

ICs 7 and 8 are 8T26s which invert the data when both programming and checking. The EOR \$FF at \$0AA0 inverts the data before it leaves the PET and another inversion occurs at \$0B42 when checking the data. If 8T28s are used these should be amended accordingly.

The circuit diagram of the device is shown at Figure 3. *J D Beaven*

Latch A	Latch B	
0	0	No action
1	1	Clear the 7493s
0	1	Clock the 7493s
1	0	Send program pulse

Table 1 Memory map for the 2716 Eprommer

\$0400 — \$09FF : Basic program  
 \$0A80 — \$0B24 : M/Code for programming  
 \$0B25 — \$0B70 : M/Code for checking  
 \$0C00 — \$13FF : Data for transfer  
 \$16F6 — \$1FFF : Reserved for monitor

The various programs are contained in the PET's 8k memory according to the memory map in Table 1. The monitor program at the top of memory is SUPERMON —

an extremely useful piece of software used for checking everything — and which now is part of an EPROM between A000 and AFFF. The program takes just under two minutes to transfer the full 2048 bytes.

The SYS instruction in line 240 of the Basic program puts us into the machine-code program, which starts at \$0A80. This uses several sub-routines which are as follows:  
 ZERO (\$0AC0) — this puts A and B to logic '0';  
 CLEAR (\$0AD0) — puts A and B to logic '1' to produce

My school and I have a lot of programs for PET. It is both messy and, with lots of children around, tempting fate to keep them all on separate cassettes.

Problem: the tape unit does not have a counter. Solution: head each tape with a contents/counter program as above.

Problem: there is no easy way to work out the value of K for each program. Solution: experience!

Note that line 250 stops tape even though F. Fwd is operating. Lines 280 to 320 automatically load and run the program.

V. Russell

## AERIAL COUPLING

Do you find it a nuisance having to unplug the TV aerial every time you want to plug in the computer? If so, then this simple coupling unit may be of use to you. It enables the TV to pick up sufficient signal from the computer without having to disconnect the aerial.

There are two ways in which it can be used. If your set has a small box on the back to convert the round co-ax lead from the aerial into the flat twin lead which actually goes to the aerial terminals of the set (as on many Japanese sets), then tape the unit onto the twin lead with the wires of the resistor running parallel with those of the lead. If you use an indoor aerial, place the unit against the aerial. It will be necessary to experiment to find the best position. With a 'toast-rack' type aerial, hanging it from one of the rods about 1/3 of the way from the front

and close to the centre line of the aerial seems quite good. In either case, if more signal is required, the leads of the resistor can be extended by up to a couple of inches each.

If you have an outside aerial, and the lead is co-ax all the way, then I am afraid that this particular unit is of no use to you.

Warnings: 1) Do not place this coupling device within the TV, or make any direct connections to the inside of the set. 2) Since the aerial is still connected, a small amount of signal could be radiated from it. This might possibly cause interference to other sets if their aerials are close to yours or if you are fed from a communal aerial system. Position the unit so that the signal induced into the aerial/aerial lead is no more than that required to stop the picture being noisy.

P. Gascoyne

## ATARI EXTRA GRAPHICS MODES

One grumble about the Atari is that, although 16 colours are available, only five can be displayed on a screen at once using just Basic. Only by using machine code could this be improved to five colours per TV line. However, this article will tell you about three more modes available in Basic, one of which allows 16 colours per TV line.

At the back of the Basic Reference Manual there is a table of nine modes and screen formats. To that table you can add three more graphics modes, each having a resolution of 80 columns by 192 rows (no

split screen allowed) and requiring 7900 bytes of RAM. The modes 9 to 11 interpret the display data bytes in groups of four bits, thus giving 16 possible values.

Mode 9 uses this data as a luminance value for colour in SETCOLOR register 4. Mode 11 uses that data as an actual colour value with the luminance of SETCOLOR register 4 (default lum of 6), although colour 0 is always at luminance 0. Mode 10 is more flexible. The value is used as an index to one of the nine colour registers available as shown in Table 1. For more details of mode

Isn't that sweet! Mother says she's knitting you a floppy disk'

# TJ's WORKSHOP

10, see later. To get you started with these new modes, try the program in Listing 1.

I can only speculate how these modes have remained unknown to most Atari users. All information in addition to the Basic Reference Manual, which all users have, comes from either the Technical Notes that be purchased from Atari dealers or from articles in American magazines, such as *Creative Computing* and *Byte*.

The Technical Notes, as mentioned last month, are rough drafts of internal documentation released (under duress?) by Atari. These are divided into two parts, Hardware Manual and Operating System User's Manual. The Hardware Manual is the more immediately interesting part as it reveals a lot of information about the graphics facilities built into the hardware. This includes details of how a customised chip, called ANTIC, is programmed to produce 14 different graphics modes, only nine of which are available from Basic. But the modes

described above are not included in these 14, they are variations of Basic mode eight. The difference is due to the way that the display data is interpreted by another chip, called CTIA, one of whose jobs is to add the colour information to the data. This chip contains the colour registers, but it is not usual practice to access these directly but via duplicate registers maintained by the OS. These addresses are shown in Table 1.

There is no hint in the description of CTIA about the existence of modes nine to 11. That comes in the OS Manual. In the section which describes how to set up and use the screen as an input/output device, it states that there are 11 modes available but that modes 9 to 11 are only available if another chip is used in place of the CTIA. Now I believe that I had a CTIA chip as nothing I had read in the Hardware Manual or in magazines had suggested otherwise. But the Notes are dated November 1980. It seemed probable that if Atari developed a replacement for the CTIA, they would be

using it in production models by now since it would not cost them any extra to produce and the Australian models must have required some rejigging anyway. So, I tried it and modes 9 and 11 were available on my 800! It was like finding another gear on a new car.

To use mode 10, you need to know the way a colour register is split up. The most significant half contains the colour number as defined in Table 9.3 in

the Basic Reference Manual. The lower half contains the luminance value. Thus, to set the colour orange (2) with a luminance of 10 into colour register 2, use the Basic statement:

```
POKE 710,2*16+10
```

To conclude, Atari have been hiding their light under a bushel. These three extra graphics modes make the machines even more attractive.

# HIGH DENSITY VDU CARD

*B J Hawkins, in a two-part feature, tells how to produce a 80 x 26 display for your Z80/8080 system.*

This article explains the principles, design and construction of a high density VDU interface card suitable for a wide range of machines and systems. Next month I'll give the assembler language driver routines to enable the VDU card to be interfaced to an 8080/8085/Z80 - based system to give a professional quality, full cursor control display screen.

Many of the single board computer systems on the market today have for reasons of economy, and so that a

modulator/domestic TV may be used as the display screen, settled on a 64 character by 16 line display format. This is ideal for the apprentice programmer in terms of cost and performance but, once hooked, the serious programmer will soon outgrow this display and yearn for a professional 80 by 26 size screen. This project provides a low cost, flexible unit that, coupled with the driver routines in next month's article, will provide a professional quality display interface with the full range of standard functions but no expensive frills. My prototype was interfaced to an 8085-based system but the design is flexible enough to be used with other microprocessors, such as the 6800 or 6502. The driver routines of Part Two would, of course, require translating into the relevant machine code language.

## Hardware design

The basic philosophy behind the hardware was to design a unit that meets the following broad criteria: 80 character

by 26 line display format, of the memory mapped, non-interlaced raster scan type; standard composite 1V peak-to-peak video output to drive a professional monitor (approx 12 MHz bandwidth); standard low power Schottky TTL and industry standard memory devices to be used as opposed to exotic and expensive LSI chips; economy of hardware by making more complex software carry out functions such as cursor generation and control, screen scrolling and automatic carriage return and line feed; and a unit that uses standard bus signals and has non-critical timing requirements, allowing it to be coupled to a wide range of processors and systems.

A raster scan display is built up of a large number of horizontal lines traced out by the electron beam in a CRT. The scan lines start at the top right hand corner of the screen and trace out the whole area of the CRT face, ending at the bottom left-hand corner; the spot then flies back to the top right-hand corner and the process is repeated (see Figure 1). This sequence is called a field and is repeated every 1/50 second or at a repetition rate of 50 Hz. Because of the visual persistence of the phosphor of the CRT and that of the human eye, this creates the illusion of a steady picture.

To produce a video picture, therefore, certain information in the form of timing and picture data must be provided. The electron beam spot must be told when to start a horizontal scan line and when to 'flyback' to start the next scan line.

In the same way, each video field must be informed when to start and when to flyback to start the next field. And finally, of course, the electron beam intensity must be modulated along each scan line to produce picture information. These timing signals and video are combined together in set proportions to give a composite video signal (see Figure 2) and this is the signal that a CRT monitor will require to produce a steady synchronised display.

Figure 3 shows a block diagram of the main circuit areas of the high density VDU card. The video information to be displayed is held in a 4 kbyte video RAM memory. This is data in the form of ASCII character codes. The main timing generation logic in the

## **From: ANDROMEDA, as exclusive distributor:**

**A-16:** 16-K RAM card. (Suits three different slots in Apple II.)

**A-RO:** ROM board.

Both very low-priced items, available ex-stock.

---

## **From: U-MICROCOMPUTER, as distributor, made in U.K.:**

**U-RAM 16:** An add-on 16-K RAM card. Runs on all Pascal application packages, electronically identical to the Apple language card, CP/M compatible. Makes integer card obsolete as DOS 3.3 loads integer to U-RAM 16.

**U-Z80:** A plug-in Z80 processor card. Allows an Apple to economically run the CP/M operating system. Provides a common environment for languages and applications software independent of the actual machine.

**U-TIM:** A low-cost timer for Apple II, which can be installed in any slot except 0. Records intervals of up to one hour with a readout down to one millisecond.

**U-TERM:** An 80-column upper and lower case display board for slot 3 in Apple II. Compatible with Basic, Pascal and CP/M without loading from software disk. U-TERM is ideal for word-processing programmes such as Wordstar.

**U-PORT:** A single board with eight serial ports to allow the sending and receiving of data. Each port is individually addressable. Can be installed in any slot except 0.

**U-MMS2:** Memory Management System II. Removes Apple DOS from the Apple's memory and places it on a 16-K RAM card in slot 0. Memory taken up is then available for use. DOS is still active, but no longer takes up precious memory. Disk access time is reduced. Longer programmes can be run or written — programme speed increased.

**U-A/D:** A 12-bit A/D, digital I/O and timer.

**U-D/T:** A digital I/O and timer — 32 parallel I/O lines, 16 buffered for relays, four counter-timers allowing five intervals from one millisecond to more than an hour to be measured or used on an interrupt basis.

---

## **From: SILICON VALLEY SYSTEMS, as exclusive distributor:**

**WORDHANDLER:** A 66-column word processor for Apple II, with full line capability on screen. No boards necessary. Two character formats to choose from at all times, upper and lower case, underlining, Superscript, bold type, unlimited tabs, proportional spacing, even and normal justification. High dealer margins.

---

## **From: SANTA CLARA SYSTEMS, as exclusive distributor:**

**SCS HARD-DISK SUB-SYSTEM:** Using Winchester disk technology, each sub-system includes a selected eight-inch or 10-inch hard-disk drive, host adaptor card, drive controller, power supply, cabinet, cables, all necessary DOS software, plus operating manuals. An optional eight-inch floppy disk drive or a removable eight-inch hard Winchester

# WANTED

cartridge drive is available with every SCS sub-system model. Available for Apple II Plus, TRS-80 models 1, 2 and 3, DEC LSI-11, Motorola 6800 Exorciser, Intel/National Multibus, S-100, Altos.

---

**From: INTEGRAL DATA SYSTEMS, as distributor:**

**PRISM:** IDS' newest range of printers. Includes Prism 80 – very high quality, low-cost, matrix, 110 or 200 cps, 80-column model; and Prism 132 – 132-column, up to 200 cps colour printer. Top quality, to retail at about A\$1,700.

---

**From: DICKENS DATA SYSTEMS, as distributor:**

**GRAPHICS:** A highly versatile business, engineering, educational, mathematics package featuring pie charts, standard bar graphs, point and line graphs, graphics displays of any mathematical function, least squares polynomial, curvefit generation, keyboard image shape tables automatic graphics disk storage, and recall.

---

**From: M & R ENTERPRISES, as sole distributor:**

**SUP'R TERMINAL** 80-column board and **SUP'R MOD** modulator for Apple II.

---

**From: EPSON, the following printers at competitive prices:**

**MX-80 I, MX-80 II, MX-80 F/T I, MX-80 F/T II, MX-82, AND MX-100.** Plus all spares and interfaces for Apple and TRS-80.

---

**From: ADVANCED LOGIC SYSTEMS, as distributor:**

**ALS SMARTTERM** 80-column board, **Z-CARD** with CP/M, **16K RAM** card, and **SYNERGIZER**. Probably the best quality Apple cards available in the market today.

---

**From: CYBORG, as exclusive distributor:**

**ISAAC:** The only computerised data acquisition system in existence for Apple. This product, which will appeal, in particular, to universities, technical colleges and government agencies, offers a whole new applications field for Apple. The product and the peripherals associated with it are suitable for those dealers who have a strong presence in the industrial/scientific field.

---

**NOTE:** Very competitive prices are also offered on product lines from Visicorp, Advanced Business Technology, H & H Scientific, Legend Industries, Videx, Solidus, Sorrento Valley Associates, Creative Computing, and many more.

*Call, telex or write to us and we will forward more details of the products we have available. If there is something you need that is not listed here, we will quote and obtain any item for you. As Apple's exclusive distributor for Asia (excluding Japan, South Korea, North Korea and China) and New Zealand, we will not sell Apple-branded products in Australia. So, don't ask! Normal terms of business are TT in advance of shipment or irrevocable LC at sight. We will also help to give credit if you are prepared to bear the costs, but will normally do so only through a factor.*

# HIGH DENSITY VDU CARD

block above scans the video memory and synchronised to the generation of horizontal and vertical synch pulses produces at the memory output a string of consecutive ASCII code bytes. These are used by the character font block to produce the serial pattern of dots on each line needed to form the required character on the screen. The mixer and video output buffer block mixes the video data and synch pulses to produce a composite video signal of the form Figure 2.

This is how ASCII characters held in the video RAM are 'mapped' to the display screen, but of course they must be first placed there by the host system. This is accomplished by the host system writing into the 'dual port video RAM'. This may occur at any time and if this were to be allowed, it would cause the display to look unsteady and 'noisy'. To prevent this happening, the circuit block called Memory Access Arbitration controls when the host system may have access to the shared memory space. This is done by detecting when in each video field the host system may have access without upsetting the video data, ie during horizontal and vertical flyback times. During these times the logic switches over the address multiplexers so that the video memory may be addressed by the host system and data may be written or read from the memory space. If the processor of the host system should attempt to access the memory at any other time it will be placed into a 'Wait' state until the next 'flyback' time occurs. Thus the video memory may only be accessed at safe times and appears to the processor as a block of normal memory, that sometimes has a long access time. (Please note that the processor is only 'slowed down' when accessing the VDU memory and its speed is not affected when it is talking to its own system memory.)

## Detailed operation

The master oscillator IC28, R1, R2, C1 and X1, uses a 12.598 MHz crystal to produce a pixel clock with a period of approximately 80 ns. Thus a pixel element, which is the smallest picture element that is displayed on the screen corresponds to 80 ns of a scan line. The basic pixel clock is divided by a factor of eight to produce a square wave character clock of 640 ns period,

	b7	b6	b5	b4	b3	b2	b1	b0

418H									44H
419H									00H
41AH									00H

PROM Address      Font      PROM Data

Fig 4 Example from character font PROM.

CHCLK, and a low going character load pulse of 80 ns every 640 ns, CHLD. Each character cell is thus composed of eight pixel elements on 11 consecutive scan lines (see Figures 4 and 5).

The character clock CHCLK is used to drive the character counter IC6 and IC8; this is a synchronous binary counter that counts from 00H to 63H (decimal 0 to 99) and is then parallel loaded by the decode produced by IC20,6 back to 00H. Thus this counter has a cycle of 64 microseconds, which is the basic line rate period required, and has seven counter output lines which give the character position on a text display line (MA0 to MA6). Flip-flop IC14 is used to produce the basic scan line rate signal HS (see Figure 6). This flip-flop is set by having a logic '1' clocked into it by a decode of the counter sequence (81 decimal) and is reset by a clear signal produced by a second decode of the counter sequence (01 decimal). (Gates IC7,8 IC20,12 IC20,6 IC11,12 IC9,3 IC4,2 and IC4,4.)

As can be seen from Figure 4, an individual cell is made up of eight pixels on 11 consecutive scan lines, hence the next step is to divide the scan line rate signal HS by 11 to produce a character line rate signal CLN. This is accomplished by counter IC10. This counter counts from zero to ten and is then parallel loaded by IC3,3 back to zero (see Figure 7). The counter output lines P0 - P3 are used to address the character look-up font to give each row of the character cell pattern.

The next step is to count the number of character text lines to give the line count addresses and the field rate signal VS. This is achieved by counter IC12 and flip-flop IC14. This is a 5-bit counter that counts from 00H to 1BH

(0 to 27 decimal) and hence has a sequence length of 19.7 ms, which gives the basic 50 Hz field rate. (Gates IC13,6 IC9,8 IC9,6 IC4,8 and IC4,6.) The counter outputs MA7 to MA11 give the character text line address, and the basic field rate signal (see Figure 8) is produced from a decode of the counter output lines (gates IC11,6 and IC9,11).

This completes the description of the block of circuitry labelled as the main timing generation logic; from it the basic system clock signals and synchronisation pulses and the raster scan bus MA0 - MA11, and P0 - P3 have been produced. Now let's look at the video RAM and its associated address multiplexers.

The video RAM consists of a 4k block of 8-bit memory composed of industry standard 2114 memory chips (IC21 - 24, IC34 - 37) and the two-to-four line decoder chip IC25. The address multiplexer consists of three quad two-to-one line multiplexers IC38, IC39 and IC40. If we assume that the signal X/I SEL is high (ie internal access selected), the raster scan bus MA0 to MA11 is selected by the address multiplexers to become the video address bus VA0 to VA11. In the internal access mode, the video memory R/W signal will always be high and the RAMs will carry out read cycles only. Hence the cycling addresses on the raster scan bus will cause the video memory to produce a string of data bytes onto the video data bus. As will be explained in greater detail in the second article of this project, the memory map is not continuous; this is to economise on the number of counters used to generate the raster scan bus. This also has the effect of allowing all the software pointers and variables needed for the driver programs to be stored in non-displayed RAM areas and gives 3/4k of extra continuous RAM for user programs.

Fig 9 Horizontal sync pulse generation.

Fig 10 Vertical sync pulse generation

The string of data bytes produced by the video RAM onto the video data bus are presented in turn to the next section of circuitry that will be described, the character font and serial converter logic. ASCII data bytes on the video data bus, VID0 - VID7, are latched into the 8-bit latch IC33 by the character load pulse CHLD. The seven l.s. bits from IC33 are connected to the seven top address lines of the character font PROM IC32. This is an industry standard 2 kbyte 2716 EPROM. The character font PROM contains 128 character patterns (see Figure 4) which each consist of 16 bytes (five of which are unused); each character is selected by its 7-bit ASCII code on the top seven address bits and the required row of the pattern is selected by the scan line address bits P0 - P3. Details of the character font patterns will be given in the second article of this project. The font row data at the output of the character font PROM is latched into the parallel inputs of the serial converter shift register IC31, by the next character

load pulse CHLD. This shift register is clocked by the pixel clock and produces a serial data stream from its QH output.

The m.s. output bit of IC33 is connected to the D input of the inverse video flip-flop IC19. The function of this flip-flop is to allow characters to be individually placed into the reversed video mode, ie to appear as black characters on a white or green background. Flip-flop IC19 is used to control the exclusive or gate IC18; this gate acts as a programmable inverter on the serial data stream from IC31. Thus if the msb of a byte in memory is set, the ASCII character given by the other seven bits will appear in reverse video on the display screen.

During the field and line flyback times the character font and serial converter logic will produce unwanted data that is not required to be displayed. The video data stream from IC18 is gated by IC3,8 with a signal called mixed blanking. This is produced by ORing the HS and VS timing signals together after they have been resynchro-

nised to the character clock CHCLK (IC2 and IC30,3). Thus IC3, from its output, produces the complete video signal carrying the picture information for each scan line and blanking information during the line and field flyback times.

To produce a composite video signal (see Figure 2) we need to add line and field synchronisation pulses to the mixed video and blanking signals. To do this the signals HSYNC & VSYNC are generated (Figures 9 and 10). The horizontal sync pulse HSYNC is produced by the horizontal sync porch generator logic (IC15, IC3,6 IC4,11 and IC4,12). This circuitry produces a line sync pulse correctly framed within the line rate signal HS. The vertical sync pulse VSYNC is produced in a similar fashion by the vertical sync porch generator logic (IC16 and IC29,3). This logic produces vertical sync pulses correctly framed within the field rate signal VS. Finally the synchronisation pulses and the mixed video and blanking signals are mixed together in the correct ratio by using open collector gates and weighting resistor networks to produce a standard composite video signal (IC1,2 IC1,4 IC1,6 & R4 to R8)

The final sections of circuitry to be described are those responsible for placing display data into the video RAM at permissible times. The memory access arbitration logic produces a signal called X/ISEL; this signal determines who has access to the video RAM. When X/ISEL is high the internal raster scan bus is scanning the memory to obtain display data, when the signal is low the external system may if it is required have access to the video RAM to read or write data. X/ISEL is produced by NORing a line flyback access signal (IC19,9) and a field flyback access signal (IC17,4); these signals in each case go non-active before the 'deadline time' to allow my previously initiated external access time to be completed without the R or W cycle being 'clipped' short. The video RAM is thus available to the host system for approximately 25 per cent of the time. The other 75 per cent of the time it is being scanned by the internal logic to display data.

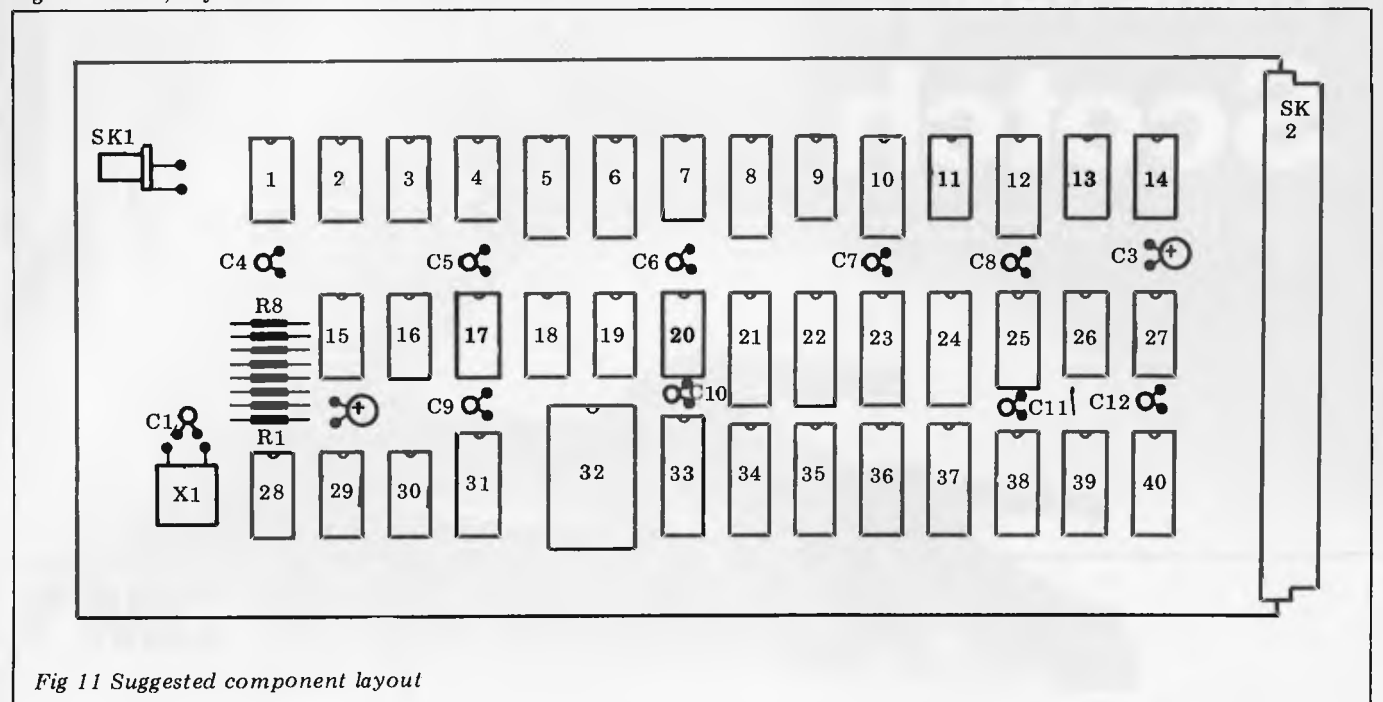

Fig 11 Suggested component layout

# HIGH DENSITY VDU CARD

The access control signal X/ISEL is used for a number of purposes: first, it controls the address multiplexer to determine who is addressing the video RAM. Secondly, it qualifies the generation of Ready/Wait signals and finally it qualifies the enabling of the memory and the control of the data bus buffers. The prototype unit was designed to fit into the host system's memory map from the address F000H to FFFFH; of course, if the necessary address changes are made to the driver routines any other 4k block could be used, and the decoding of the top four address lines A12 - A15 changed to suit. When the host system attempts to access the video RAM the decode signal FxxxH will go low (IC13,8).

If the signal X/ISEL is high (ie internal access selected), this will cause the Ready/Wait line to go low forcing the processor into a wait state. When the signal X/ISEL goes low (ie external access selected) the wait signal is removed and the accesses allowed to continue as required until X/ISEL goes high again. During a read or write cycle to the video RAM the active strobe is used to enable the memory in a read or write mode and to control the data buffers to correctly input or output onto the system data bus (Gates IC3,11 IC29,8 IC30,6 IC30,8 IC17,10 IC29,11 and data buffers IC26 and IC27).

This completes the description of the high density VDU card hardware operation.

## Construction

My prototype was constructed using wire wrap sockets and pins, but any suitable technique may be used as long as adequate power and ground bussing is provided. The circuitry uses a single +5V power rail at approx 1.1 amps. Figure 11 shows a suggested component layout for an extended Eurocard (220mmx100mm) matrix card, and Figure 12 gives a parts list for the project. The video output to the monitor should be kept as short as possible and a good quality monitor of at least 12 MHz bandwidth used. A modulator/TV combination will *not* have the bandwidth/resolution to give a good display.

## Added features

There are a couple of extra features that could be added to the hardware quite easily: a low frequency square wave generated by further dividers from the line counters could be gated with the output of the inverse video flip-flop to allow selected characters to alternate between normal and inverse video fields; the character font PROM could be replaced by a dual-port RAM memory operating in the same way as the main video RAM (this would allow the user to load any character or graphics font required down from the host system).

## Software Profile

DBASE II by ASHTON-TATE (Version 2.3) \$675

We firmly believe that DBASE II is the most powerful and easiest to use data base management system currently available for Z80 or 8080 based microcomputers using the CP/M (or equivalent) operating system.

It creates a true file-level relational data base allowing users to manipulate data within and between files without complex links or hierarchical structures. Data entry is very simple, as is editing, re-arranging and reporting on data from one or more files.

These operations may be performed by direct communication with DBASE, but for those who wish to create a fully integrated system with computer-generated screens of processing options and prompts DBASE comes complete with its own easy to use editor and structured programming language which will cope with any application.

We are supplying and supporting the latest revision and ASHTON-TATE's ongoing commitment to the development of DBASE ensures that the package will continue to hold its current enviable and well deserved position in the field of data base management systems.

\* Call for details of the 30 day trial offer with DBASE II and for details of our other products.

# HOW COMPUTERS COMMUNICATE.

Part VI

## THE UNSTANDARD INTERFACE: SERIAL I/O

by Hewlett Packard's Steve Leibson

The fact that the computer represents a relatively new technology may lead you to believe that I/O does also. The first electronic computers appeared in the 1940s, and serious work in computer data communications did not start until the next decade.

But when engineers did begin to connect computers to other devices, they used a technology that originated in the previous century — serial I/O.

### ENCODING FOR MACHINES

The first electrical device used extensively for communications was the telegraph. Samuel Morse improved the telegraph mechanically, but more

importantly, he devised the Morse Code. This was the first really practical encoding of the symbols humans use for communications into a machine-transmittable form.

Symbols are represented in the code by a series of dots and dashes, each character having its own unique representation. The dots and dashes may be considered the predecessors to the ones and zeros of the modern character codes we use in computer data communications.

Improvements of the telegraph led to printing telegraphs that required no human operator to decipher the codes. New codes and more advanced machines were devised, culminating in the teletypewriter.

By the time of the teletypewriter, dots and dashes had become ones and zeros. Morse code was discarded in favor of codes that assigned the same number of bits to each character. This made it much easier for machines to decode. By the time electronic computers were invented, there already existed a wealth of technology for electronic data communications.

At first, teletypewriters served as I/O devices between humans and computers. The keyboard and printer of the teletypewriter provided a low-cost data entry and display mechanism. As technology progressed, terminals and faster printers replaced the teletypewriters, but retained serial I/O interfacing.

### TRANSMITTING OVER ONE WIRE

The basis for serial data communications is the transmission of information over a single wire.

Interfacing techniques previously discussed in this series have relied on several parallel wires to carry information between devices. Each wire carries a single bit of a character composed of multiple bits.

When long distances are involved, the cost of running several wires in parallel becomes prohibitive. Serial interfacing is the solution.

Time sharing was born when computers became sufficiently powerful to handle several tasks simultaneously. Since computers were still very expensive, it was necessary to spread their cost over many users.

The problem then was how to connect users at several locations to the central computer facility. Stringing wires to each location was too expensive. Fortunately, such communication lines already existed. They belonged to the phone system.

### BUILDING A STANDARD

Unfortunately, these connections were not necessarily wires. They could just as easily have been satellite or land-based microwave links, since these also made up the phone system. All were designed to carry voice signals, not computer data.

In addition, phone companies were extremely unhappy at the prospect of finding all kinds of strange signals in their networks. Because teletypewriters did not have standardised interfacing requirements the voltages involved could range anywhere from 6 to 140 volts. A standard was required.

The Electronic Industries Association (EIA) standard RS-232C resulted. This standard was specifically developed to do one thing. It defines the electrical characteristics for an interface between a piece of data terminal equipment (DTE) and a piece of data communications equipment (DCE). DTE is the

terminal for the timeshare user, while DCE is a modulator-demodulator (modem) which encodes the computer data into voice-like signals that are permissible on the phone system.

Figure 1 is a picture of the wires associated with the RS-232C standard. Note that there is actually more than one wire involved. Pins 2 and 3 are the data-carrying wires, called transmitted and received data. Pin 7 is a signal ground serving as a signal current return path. These three wires are sufficient for communications between DCE and DTE.

What are all the other wires for, then? They serve as control wires between the DTE and DCE and are there merely for establishing and maintaining communications with the computer. Let's ignore them for now and examine the data wires more closely.

## EXAMINING DATA WIRES

Information is sent out on the transmitted-data line while signals are received on the received-data line.

Note that this is not the same as the IEEE interfacing standard discussed previously. On that interface, one set of data lines carried information in both directions. Technology had not progressed sufficiently for RS-232C to have bidirectional signal lines.

Who transmits on the transmitted data line? All of the names for the RS-232C signals are from the perspective of the DTE. So the DTE transmits on the transmitted data line and the DCE receives it.

Similarly, the DTE receives data on the received line and the DCE transmits on it. Figure 2 should clear up any confusion about this.

Now let's get confused again. We have a computer and a printer. We are going to connect them using their "standard" RS-232C cables.

But which of them is the DTE and which is the DCE? More specifically, which is going to transmit on pin 2 of the connector and which on pin 3? Neither the computer nor the printer is a terminal or a modem.

Manufacturers of these instruments may offer cables to allow their equipment to look like either DTE or DCE. More often however, the RS-232C connector is installed on the rear panel of the instrument and no choice is possible. In the case of two instruments of the same type, a crosswire cable may have to be assembled to get signals on

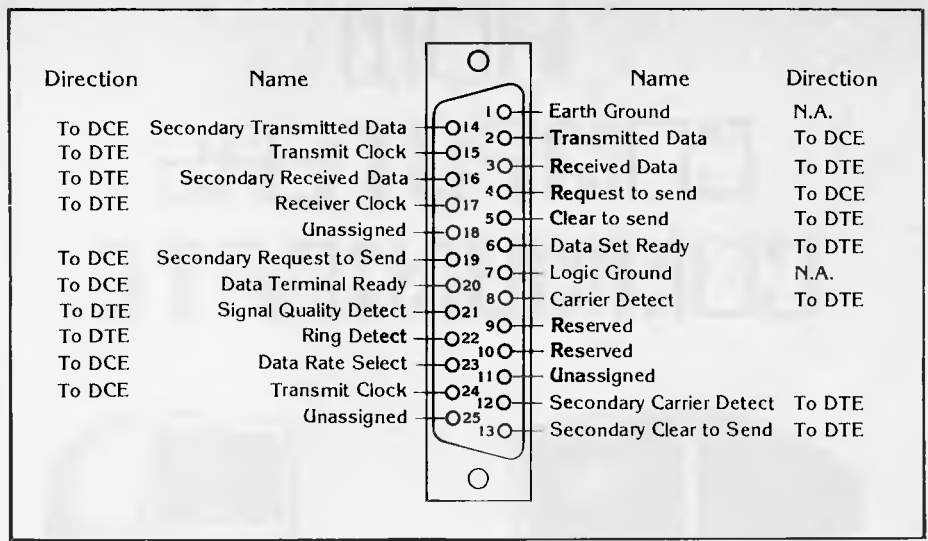

Figure 1

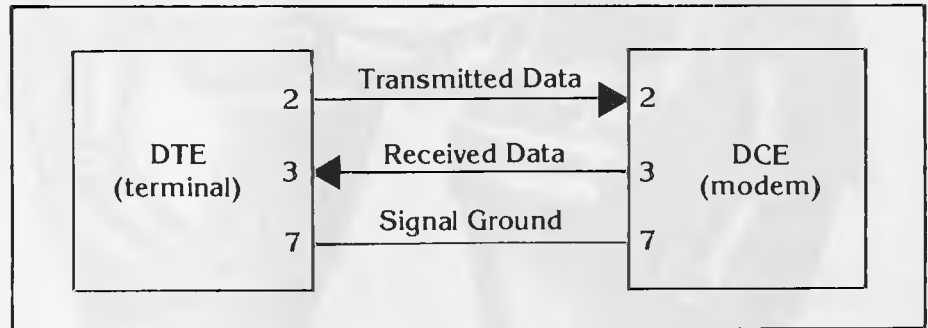

Figure 2

the correct wires. Usually this task falls to the user.

We have just covered one source of incompatibility between pieces of RS-232C equipment: plug-to-plug. In order to discuss other potential problems we must understand the data signal.

First, the data signal levels are not like those of the interfaces we have discussed previously. Those interfaces were based on TTL integrated circuits. That logic family is based on 0- and 5-volt signals.

RS-232C was a standard long before TTL and so uses different voltage levels. A positive voltage between 5 and 25 volts is used to represent a logic 0 while a negative voltage between -5 and -25 volts is used to represent a logic 1.

These levels are only for the data lines which use negative true logic. The control lines all use positive true logic and so a positive voltage represents a logic 1 and a negative voltage represents a logic 0.

Because the bits of a character are separated by time, a waveform is produced when transmitting a character. Such a waveform for transmitting the character "E" is shown in figure 3. The ASCII code for "E" is 10000101 in binary and is transmitted least significant bit first. The data line idles in the "1" state.

## WAITING FOR THE START BIT

A start bit is always sent first to mark the beginning of the character. Then

data bits are sent in order from least significant to most significant, each bit remaining on the line for a precisely-arranged length of time called a bit time.

The receiver, alerted to the incoming character by the start bit, times the incoming signal and samples the state of the data line as close to the centre of the bit as it can. Naturally, both the transmitter and receiver must agree on the length of time each bit will be given on the line or the transmission will be garbled by samplings taken at the wrong times.

This bit time determines the maximum rate at which bits may be transmitted and thus defines the "bit rate" at which this particular serial interface is running. Standard bit rates are 50, 75, 110, 134.5, 150, 300, 600, 1200, 1800, 2400, 3600, 4800, and 9600 bits per second.

Following the data bits in the transmission, there may be a parity bit, used for error detection. If a noise pulse should affect the data line at the wrong time, a bit in the transmission could be misread.

If the transmitter keeps track of the number of 1s in the character being transmitted, it could set the parity bit so that the total was either always even (even parity), or always odd (odd parity). The receiver can also keep track and use the parity bit to determine whether the transmission was received in error.

The last bits to be transmitted are the stop bits. These bits carry no information but allow the receiver time to prepare for the next character.

There may be 1, 1.5 or 2 bits. Since this period is really just a resting time, fractional bits are allowed.

## PICKING UP THE PIECES

Now, what might go wrong? There are several parameters on which the transmitter and the receiver must agree. The bit rate has already been mentioned. In addition, the parity (odd, even or none) and the number of stop bits both have to be the same in the transmitter and the receiver.

Character codes also have to be considered. Our example used the ASCII code that is the most commonly used character code today. ASCII is a seven-bit code. Other codes do exist however, and may include 5 bits (Baudot and Murray), 6 bits (IBM Correspondence Code) and 8 bits (EBCDIC). The RS-232C standard makes no mention of what code should be used.

Now that we have our computer and printer connected so that they use the proper wires and they agree on bit rate, parity, number of stop bits and character codes, you may feel that the problem has been solved. — Not so. The printer uses the ASCII character set, has odd parity, and one stop bit. In addition, it has a switch for setting the bit rate up to 9600 baud.

Well, that's fine. We set the switch to its fastest setting so that our equipment doesn't waste a lot of time sending characters. We also set the computer to the same settings so that both the transmitter and the receiver agree on all of the parameters.

## FINDING THE PROBLEM

We then write a program on the computer to send one line of print to the printer and it works! Finally, we list out the program on the printer so that we have a copy of our triumph. Unfortunately, several characters are lost in the transmission. We try again with equally dismal results. We run the program once more, and now that line prints perfectly. What is going wrong?

First, let's consider the data rate at which the computer is sending information. We are using ASCII (7 bits) plus a parity bit, a stop bit, and a start bit for a total of 10 bits. We are transmitting these 10-bit pieces of information at 9600 bits per second, which translates into 960 characters per second.

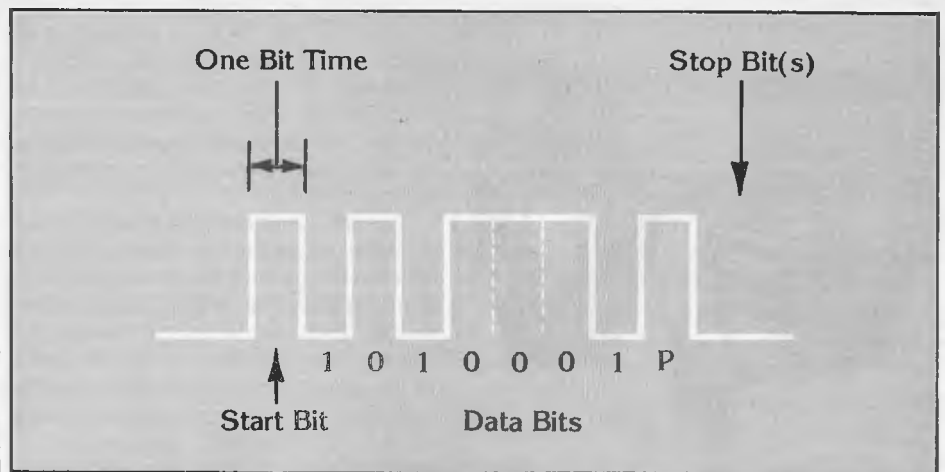

Figure 3

The printer manual specifies that the printer can print 175 characters per second. We are sending information to the printer at more than five times the rate it can print them! The printer does have an internal buffer for 127 characters. After that, the transmitter must wait to allow the buffer to partially empty.

When we ran the program, fewer than 127 characters were sent to the printer and the printer's buffer could handle the data rate. Listing the program sent more than 127 characters to the printer and the buffer overflowed, causing some characters to be lost.

In previous articles, we discussed interfaces that had handshake mechanisms which prevented transmitters of information from going too fast for their receivers. Surely RS-232C must have a handshake mechanism also — but no, this is not always true.

Returning to figure 1, we will now consider the other RS-232C signals. We are looking in particular for two sets of handshake lines, one for the transmitted data line and the other for the received data line.

Aha! Pins 4 and 5, request-to-send and clear-to-send, look like prime contenders. And many printer manufacturers have fallen into this trap. According to the strict RS-232C definition, the DTE asserts the request-to-send line when it has some data to transmit. It then waits for the DCE to assert the clear-to-send line before transmitting.

That is one half of a traditional handshake. The problem is that the DCE is not allowed to drop the clear-to-send line until DTE has dropped the request-to-send line.

## TAKE A LONG DRINK

The situation is similar to taking a drink from a garden hose with a friend controlling the nozzle. It's easy to start the flow, but you had better be prepared to take either a long drink or a short shower.

The DTE and DCE signals were intended as a handshake between the terminal and the modem to allow the terminal to request control of the communications link from the modem. It also makes it possible for the modem to tell the terminal when control has been acquired.

Some manufacturers have ignored this strict definition and used the clear-to-send line as a handshake line anyway. Others avoid the definition conflict by using the data-terminal-ready or data-set-ready line (depending on whether they are emulating a terminal or modem). None of these lines was intended for the purpose of handshaking characters, however, and use by one instrument does not guarantee recognition by the other.

Let us consider the possibilities of using the clear-to-send line. If the printer drops the clear-to-send signal

Instead of positive and negative voltage levels to represent logic 0 and 1 levels, current loop uses the absence of presence of current. Presence may be either 20 or 60 milliamps depending on the teletypewriter model. There is no standard connector or pinout for teletypewriters.

Despite all these problems, designers of serial interfaces for computers strive to include current loop capabilities in their designs. Where RS-232C is limited to 50 feet for a direct connection, current loop can be run much farther. In addition, the teletypewriter interface has been around for many years, and several instruments, still useful to connect to computers, use it. Teletype-

writers remain a cost-effective solution as a combination printer and terminal.

### HANDLE WITH CARE

As you can see, serial interfacing needs to be approached more carefully than other forms of hardware interfacing techniques. There are several factors that are far from being standardized.

As technology progresses, serial interfaces become more adept at covering an ever-widening range of hardware. Unfortunately, this still doesn't guarantee an efficient interface in every application, because serial I/O remains the unstandard interface.

in the middle of a character, what should the computer do?

If it stops immediately in the middle of a character, the character is certain to be garbled. If it waits till the end of the current character to stop, it may overrun the receiver's buffer. Because this possibility is not covered in the standard, the results are not predictable without carefully reading manuals for both instruments.

Finally, consider the device that started this discussion, the teletypewriter. The RS-232C standard at least defines signal levels and a pinout on a connector. There are no standards for teletypewriters. The serial transmission concepts are the same with start and stop bits, data bits and parity bits, but the signal interface is called current loop.

THE BULLET  
**XXX**  
WAVE MATE INC.

- \* 4 Mhz Z-80A CPU
- \* 128 K byte of RAM with bank select
- \* Single/Double density floppy disk controller for both 5 1/4 inch and 8 inch drives
- \* DMA floppy disk operation with high speed RAM buffer
- \* General purpose external DMA I/O
- \* 2 serial ports with transmission rates to 76.8 baud
- \* Centronics printer port
- \* IMI or Corvus Winchester interface

- \* Vectored interrupts
- \* Real Time clock
- \* 5 volts only
- \* Full disk track buffering
- \* Keyboard type-ahead
- \* Disk write verification
- \* Optional 2 user MP/M operation
- \* Compact size - 8 x 10.7 inches
- \* One year limited warranty on all WAVE MATE manufactured products.

## Orange Micro

(Price \$275.00 + 17 1/2% S/Tax)

### FEATURES:

- \* runs Apple™ software
  - \* will take all add on cards as it has same type BUSS
  - \* PAL is on main board, saves buying a PAL add on card
  - \* board is fully socketed and has all passive components and crystal. Just add IC's, ROM's, keyboard, power supply and case
  - \* plug straight into your home colour TV via RF modulator and save on buying a monitor
- TM Reg Trade Mark of Apple Computers Inc.

Dealer enquiries invited

512 Bridge Road, Richmond, Victoria 3121 Telephone: (03) 429 5844

AVAILABLE FROM:

COMP-SOFT (03) 428 5269, MICRO-BASE (WA) (09) 328 9308, MICRO VISIONS (NSW) (02) 662 4063, CUSTOM COMPUTER SERV (QLD) (07) 204 4995, COASTAL COMPUTERS (TAS) (004) 31 3259

Recommended retail price \$2500 plus sales tax

## FEATURES

1. Low profile design (6" high) to fit easily into your system.
2. Downloading wheel and impact sequences, allowing use of a variety of unique wheels to tune printer to OEM's specific needs.
3. Uses industry-standard wheels and ribbon cartridges available from multiple sources at low prices.
4. Comes in two Shannon-text-rated speeds: 40 CPS and 55 CPS.
5. Industry standard parallel or RS232-C interfaces and ETX/ACK, X-ON/X-OFF protocols provide maximum OEM flexibility and installation ease.
6. Extensive built-in word processing functions that allow easy adaptability and reduced software complexity.
7. Uses mono and dual plastic wheels (Unlike metal wheels, dual plastic provides superior print quality over the entire life of the wheel).
8. Field proven firmware intensive technology for increased reliability.
9. Cast aluminium base plate with high quality metal parts.
10. Low noise operation, ideal for office environment.
11. Choice of friction feed or bidirectional tractor feed for precise positioning of tabular and graphics data.
12. Universal power supply is standard and allows worldwide power source compatibility.
13. FCC approved and under 50 lbs. in weight for fast shipments and sales.

## CALCULATOR CORNER

Compiled by Dick Pountain

### Hewlett-Packard in a loop

On first hearing, the notion of networking HP-41C programmable calculators sounds a little daft — calculators are almost by definition personal and private instruments. Nevertheless, Hewlett-Packard has just announced a new interface, HP-IL, which does just that, and on closer examination it is far from daft.

It was, of course, Hewlett-Packard which invented the HP-IB interface for its large computers, and this, under its better known name of IEEE, has become an international standard for instrument control. HP is therefore no newcomer to the art of interface design.

HP-IL (the IL stands for Interface Loop) is as the name suggests a closed loop, using two wires to connect up to 961 devices in series. The reason that it isn't daft is that HP has announced at the same time several new peripherals to go onto the loop, as well as an interface card, for the HP-85 micro.

The first remarkable thing about HP-IL is its transmission capability, namely that data can be moved up to 5 kb per second (in one direction), and the distance between devices may be up to 100 metres; this, don't forget, is with *battery-powered* devices! For comparison, the widely used RS232 serial interface only allows five feet between stations.

The loop is operated on a 'master-slave' basis, where one device is nominated as master and sends a command around the ring which is received and passed on by each device in turn until it arrives back at the master; only the device for which the command is intended will act upon it. This system allows error checking, since the master can see whether the command is the same as when originally sent. A polling system allows user programs to be quite unspecific about devices, needing to specify neither address nor device number. For instance, a PRINT instruction will send a command that looks for any printer on the loop and activates the first one it finds.

So what can you hang on such a loop and why? The new peripherals announced include a digital cassette recorder, a new thermal printer, two new memory expansions, a real-time clock unit and a digital multimeter, plus interface adaptors for the HP-85 and for measuring instruments.

The cassette recorder provides 131k of storage per micro-cassette, using digital rather than audio encoding for speed and reliability. Searching is performed at 30in/sec. Programs as well as data can be stored in named files, and a directory is kept as on a floppy disk.

The thermal printer is basically the same unit as the current HP-41C printer but with the interface logic built in to allow its HP-IL use.

Two RAM extensions called HP82180 and 82181 allow the expansion of an HP41 C/CV to 6.5k of continuous memory. The first-named module contains, in addition to 889 bytes of RAM, a set of extended memory functions in ROM, which enable transfers to be made between main RAM and the 82181 module, two of which (1666 bytes apiece) may be added. Thus the extended memory is not contiguous with the main RAM but is addressed as an external device using the new commands to set up files. File types supported are Program, Data and ASCII; this last being particularly useful for communicating with another computer such as the HP-80 series.

So what can you use HP-IL for? One obvious application is merely to allow attachment of the printer, cassette recorder and expansion memory to a single HP-41C. Another, more novel, is to include an instrument like the multimeter in the loop and control it from a 41C, processing its data output and storing it on tape or printing it. Using the real-time clock module this could be made to be an automatic

process, sampling at regular intervals without human intervention. Since all these peripherals are battery-operated, this could all happen just as well in the middle of a forest or desert as in the laboratory. In addition to HP's own multimeter a board has been produced to build into other instruments making them HP-IL compatible.

If you want to go the whole hog you can stick an HP-85 microcomputer into the loop so that data can be passed between one or more hand-held HP41Cs and the computer: the 41C thus becomes an intelligent data capture terminal. Obviously programs cannot be downloaded since the 41C doesn't speak Basic and vice versa; data must be sent in ASCII form.

HP intends HP-IL to become a permanent and extensive 'small systems' interface, and is planning to make all its future small products compatible with it. Rumoured for the near future is a video interface to allow the 41C to display on a CRT, and an HP-IL/RS232 connector.

With the introduction of this product the 41C/CV now more than lives up to the title of 'hand-held computer' and the system should prove a cost-effective solution to a variety of laboratory data-logging problems, especially where mains power is unreliable or unavailable. I look forward to testing some of this hardware in the near future and perhaps comparing it with the Panasonic HHC which is the only other hand-held system which approaches the HP's new found abilities. **END**

# 'It's a Xerox' now means:

## More!

**The Micro-computer/information processor  
for everyone.**

The new low cost Xerox 820 is probably the most versatile business tool you can sit on your desk. Its processing power and versatility make it an indispensable tool in the office, the surgery, the warehouse even the home!

This easy to use "everybody's" system is revolutionizing the way people work and do business everywhere! Real savings are only a part of the Xerox 820 story! Because it is a Xerox we know you will be happy with the products performance. We also know that you and your staff will find it easy to use.

As it may be your first Computer, Word Processor or both, we know that you will feel a little more at ease knowing there is someone close by who cares and can help you out. Just in case .....

That is why there is now a national network of dealers selling and supporting the 820! These dealers will install your equipment, train your staff, will be on hand to advise and will continue to maintain an all important communication link with you.

You may want to find out more about the 820 or how to become a Xerox 820 Dealer, please do not hesitate to contact us. "It's a Xerox" now means a lot more:- find out for yourself, call Novex Data Systems (Australia) Pty. Ltd., Authorised Distributor for the Xerox 820, Melbourne (03) 267 5544

## Success at last

The submission of PET 'Fantasy' by Jeff Aughton from your February edition who states that no one has yet succeeded in gaining enough treasure in which to escape has now been proved wrong.

It all began when we arrived at school to find that it was to close down for the day at 12.30pm, but a handful of us from our year twelve computer club, plus teacher, attempted to get out of the adventure game using a 32k 40 column PET for which the program was designed, and after three hours we eventually got out.

This wasn't done by pure chance but by the use of a map which was constructed very laboriously by trying each exit given to us, and so we found that we had consequently drawn a foolproof map which would work each time the program was run.

The program was a great challenge to us all and we praise all the various other programs which have been submitted by Jeff Aughton in the past.  
J. Chapman

## HP-85ers wanted

I'd like to contact other HP-85 users to exchange programs and methods, especially ones using the HP-IB and serial interface. Please contact: Rosy Thompson, 71 Beachcomber Avenue, Bundeeern, N.S.W. 2230

## One liner

The conversion of decimal numbers to binary often causes problems, particularly when negative numbers are converted using '2's complement'.

Here is a compact conversion program in Microsoft

2 Basic which can be added to a collection of 'one-liners'.

```
0 INPUTD:D=D/16A4:
FOR I=0 TO 15:D=2*
(D-INT(D)):PRINT-
(D>=1):NEXT:RUN
Jack Pike.
```

## Relocatable codes

I note with much interest Mr Jeff Richards' method of arranging relocatable machine code, even where easy instructions are not available in the CPU instruction sets (APC, Feb 1982). This is a question that has been raised a number of times in recent months in several overseas micro magazines.

The issue is solvable only if we have an instruction that gives a "Where are we?" answer. Mr Richards correctly decides that we need, in the absence of an intrinsic CPU function of this sort (e.g. LD HL,PC in Z80 style notation), one calls on a fixed address subroutine to help out. Mr Richards uses his SETUP subroutine.

Now, the TRS-80 Model 1, at least, has such a routine already in ROM. At location 000B, are the two lines of code:

```
POP HL
JP (HL)
```

I believe neither ROM Basic, nor Disk Basic, nor DOS uses this little routine. A call to 000B puts the caller's absolute address into HL, then returns to the caller. Voila! Exactly as good as LD HL,PC.

Mr Richards indicates that while a "relative call" is achievable over short jumps, using JR (jump relative) calls, longer calls are a problem. However, longer calls can be made using JP (HL) to anywhere in memory.

I include listings for the following (for the Z80/TRS-80):

1. A relocatable long jump.
2. A relocatable short call (or "relative call").
3. A relocatable long call.

4. The suitable subroutine for calls 2 and 3 above.
5. A relocatable reference to

a buffer or pointer.  
B. Lavery.

```

## Missing matrices

How do I replace commands such as MAT A=B, MAT PRINT, etc. These are available on the Mainframe that I use at college, but not on my brother's micro.  
L Lee.

Not many micros support these commands because of the amount of extra space the compiler/interpreter would use. Just in case some people have never heard of these commands I will briefly outline what they do.

The MAT commands handle and manipulate arrays using a single statement. The statements only know how to manipulate the arrays because they have already been dimensioned using a DIM statement. Suppose we have statement DIM A (10,3), B (10,3), C (10,3) then a statement such as MAT PRINT A will print the whole array A. MAT C=A will copy the whole array A into array C. There are many statements that can be used — for example, MAT C=A+D — and operators such as +, = and \* can be used with many other functions possible.

There is insufficient space here to describe the full meaning of the words such as the 'transpose' of a matrix so I will just give their equivalent Basic constructs. The arrays must have been previously dimensioned as DIM A (M,N), B (M,N), C (M,N).

Editor.

MAT A=B

```
10 FOR I=1 TO M
20 FOR J=1 TO N
30 LET A(I,J)=B(I,J)
40 NEXT J
50 NEXT I
```

Use the above program and make the changes below  
MAT PRINT A — replace 30 PRINT A(I,J);  
insert 45 PRINT

```
MAT B=CON 30 B(I,J)=1
MAT B=ZER 30 B(I,J)=0
MAT B=IDN omit line 20,40
30 B(I,I)=1 matrix must be square ie M=N
MAT INPUT A 30 INPUT A(I,J)
MAT C=A+B 30 C(I,J)=A(I,J)+B(I,J)
MAT C=(K)*A 30 C(I,J)=K*A(I,J)
MAT C=A-B 30 C(I,J)=A(I,J)-B(I,J)
MAT C=TRN(A) 30 C(I,J)=A(J,I) matrix must be square
MAT C=INV too complex to do here, refer to a book on matrices.
```

MAT C=A\*B

Matrices must be compatible, ie dimensions of M x N and N x P  
5 MAT C=ZER  
10 FOR I=1 TO M  
20 FOR K=1 TO P  
30 FOR J=1 TO N  
40 C(I,K)=C(I,K)+A(I,J)\*B(J,K)  
50 NEXT J  
60 NEXT K  
70 NEXT I

## VIC Comal?

Would it be possible on the VIC-20 to use other languages like Comal-80? I am a very frustrated Basic user — a change would do me good!  
G Doyle

Basic is most popular on 8-bit microcomputers for a number of reasons, not all of which are still valid. Comal-80 has been implemented on the Commodore PET and there appears to be no reason why, given sufficient memory, a version could not be implemented on the VIC-20. As yet such a version does not exist, but it should not prove too difficult to do.

## Osborne maths?

Is the Osborne 1 reasonably accurate for use by a mathematician? Does it have high resolution graphics? Is colour available as standard or as an option? Does it have programmable function keys? If the answers to the first two are 'no', can you suggest an alternative, at no greater expense?

S Mahmood.

I am not sure how much 'accuracy' you have in mind. In my general computing experience (as opposed to microcomputing) it is the accountants who tend to demand the highest level of

precision, although certain physical sciences (especially astronomy) can demand accurate values for small differences between large numbers, which demands a high level of precision.

In any case, the number of significant figures accurately attainable is a function, firstly, of the 'word-size' of the CPU, and secondly, of the software. As you know, all 8-bit micros are limited to five significant figures (or even to four) when handling numbers without any special software or hardware. However, as the Osborne 1 runs under CP/M you should have little difficulty in getting software for whatever precision you need, or of adopting routines in high level languages if you want to do something like calculating pi to many places. If you use a Basic, which uses BCD coding for 'real' numbers, rather than the commoner pure binary notation, you will also eliminate errors due to the conversion from decimal to binary and back. MBasic (which runs under CP/M) supports the 'double precision' option, this allows around 12 significant figures.

I regret to say that the answer to all three of your other questions is 'no'. As regards alternatives to the Osborne 1, at no greater cost, which offer high resolution graphics, and colour, the first point is that none of the possibilities will offer the same degree of portability. Having said this, you may like to consider choosing from a wide range which includes the Apple II with extra cards. Atari 800. Hewlett-Packard HP 45/85, suitably expanded.

Editor

## Laser printers

As part of a recent school pro-

ject I am collecting information on the different types of printers. I cannot find information on two types, and would be grateful for your help. The types in question are electrostatic and laser printers.  
S Grimes.

There are two types of printers which can be referred to as 'electrostatic'. The more common type prints on special aluminium coated paper using a dot matrix technique. For each dot to be printed an electrically generated spark evaporates the very thin coating of aluminium, leaving the dark coloured paper to show through. The resultant print out is not very elegant, but does yield good photocopies! These printers are relatively cheap, and are often used as screen printers. The new Sinclair ZX printer uses this technique.

The term 'electrostatic printer' is also applied to certain specialised printers based on the xerographic process, incorporated in 'communicating photocopiers'.

Laser printers are currently being developed, particularly by IBM, to provide a fast 'letter quality' printer for word processing in particular. These printers use semiconductor lasers to burn patterns into paper, the patterns being letters, numbers or other special symbols, including 'graphics' if required. The technique is claimed to work with ordinary paper, and needs no ink or ribbons.

Have you included the 'ink-jet' printer in your collection? These very versatile, and increasingly popular printers operate by squirting small drops of ink onto the paper, in controlled patterns. The ink drops are often steered onto the paper electrostatically.

# Tandy's TRS-80<sup>®</sup> Model III is Your Best Buy in Desktop Computers

**Because You Get 48K at  
Last Year's 32K Price!**

That's right, we've added 16K more memory, but kept the price at a low \$3299! The TRS-80 Model III is a *complete*, ready-to-run desktop computer packed with "extras" that don't cost extra:

**Two Double-Density Disk Drives.** You get two *built-in* 175K disk drives, and can add up to two more externally.

**BASIC in 14K ROM.** Our powerful Model III BASIC provides a programme line editor, machine language programming, real time clock, and more. Compatible with most Model I Level II BASIC programmes, too. Plus, you can expand with COBOL or Compiler BASIC any time.

**Upper and Lower Case Characters.** With a special graphics character set, and 64 characters-per-line format.

**Built-In Monitor.** 30.5 cm high-resolution.

**12-Key Datapad.** As well as repeating keys and keyboard-controlled screen print.

**Parallel Printer Port.** Add one of our printers anytime.

**RS-232 Serial Interface.** For data communications, just add a modem.

**Australia-wide Support.** Backed by 300 Tandy dealers and stores, 10 Computer Centres and 8 Service Centres throughout Australia.

**Available Now.** Why pay more? Get a demonstration today. Also check out our \$1399 16K Model III — it's a perfect "starter" system.

**Tandy**

# A SOPHISTICATED COLOUR PRINTER FOR UNDER \$2000!

## The CASE CX80.

- Prints 7 colour graphs, piecharts, etc.
- 96 ASCII and 64 Pet Graphics characters
- Dot addressable graphics
- Uses normal tractor feed paper

The CX80 Colour Matrix Printer allows you to get the message across more clearly, with maximum visual impact. It also reduces information clutter, thereby minimising errors.

# APC-80

Version 6

*APC-80, the popular series for TRS-80s and System 80s continues this month, presenting a new routine to save time, finger-nails and frustration.*

I imagine that almost everyone is familiar with the annoying experience of typing a long line of Basic statements for immediate execution (i.e. without a line number) and, upon pressing the enter key, discovering a typing error somewhere in the line. The only course of action is to type the entire line all over again, usually creating a new error in the process.

Not any more! APC-80 version six provides you with the facility of editing and re-entering the last command line, thereby allowing typing errors to be corrected easily and quickly. It also allows you to re-execute the last command line even if there were nothing wrong with it.

The facility is invoked by pressing shift, down arrow and "E", all at the same time. It results in the old contents of the I/O buffer being called up and passed to the standard level II EDIT routine, implying that all the normal features of the EDIT command are available (all except "A", as explained later). The line may then be changed in whatever way you like, or left the same for re-execution, and when EDIT is exited via the ENTER or "E" command, the line will be passed to the interpreter for execution. The facility cannot be used within Basic programs for the simple reason that the level II EDIT routine is not that flexible. Remember that since APC-80 assumes the I/O buffer to be untouched since the last line was entered, if you type the same characters and then backspace and try to call up the last line entered, the result you will be editing is a combination of the previous line and the characters which you had typed on the current line. The level II ROM routines place new characters into the I/O buffer as they are typed, and backspacing does not remove them from the buffer.

To test the new routine, try this simple experiment. Type the line

```
A=A+1 : PRINT "A=" ; A
```

and press enter. Naturally enough it should tell you that A is equal to one. Then invoke the new APC-80 function by pressing shift, down arrow and "E". The cursor should advance one space to indicate the editor is active. Then press either "E" or enter to exit the edit routine (the two edit commands are the same, except "enter" which will also list the line as it exits), and you should find

that it prints "A=2". You can repeat this process until the novelty wears off, and each time the value of A should change by one. Once you have convinced yourself that this works, enter the APC-80 editor again (shift, down arrow, "E") and try changing the line slightly, for example, change the "1" to "2". You should now find that the value of A is changing by two each time. If this works, you can be sure that APC-80 has been set up correctly and relax in the knowledge that the routine is there to be called up next time you make a typing error.

## APC-80 UPDATES

The procedure for including this new APC-80 facility is very easy. Simply load up your existing version of APC-80 in Basic, and type in the lines shown in listing one, being extremely careful not to make any errors, such as mis-reading a character "B" as a number "8". When this is complete, save the Basic program back to tape and APC-80 is ready to run. Note that the memory size to use when running version six is 31700.

## HOW IT WORKS

Looking now at listing two, we see the assembler version of the new APC-80 routine. The routine is linked into the calling chain of routines which are activated every time the keyboard is scanned. This routine ("REDO") is called by another routine everytime that routine wants to check out the keyboard. In fact, the calling routine is itself called from a routine one level further back, and so on, through many levels. The REDO routine calls another APC-80 routine called DEBOUN, to scan the keyboard and tests the result to see if the special code is activated (shift, down arrow, "E" has the ASCII code of 05). If the special code were not entered, REDO returns to its caller in the normal way.

Once it has been determined that the required combination of keys are down, REDO then checks to make sure it has not been called from an executing Basic program. If everything is OK (that is, we are in command mode), REDO grabs the I/O buffer pointer and decrements it twice to ensure the first

two bytes are also included. This is necessary because the first two bytes of the I/O buffer are used to store the line number, if one were entered. The adjusted I/O pointer is then pushed onto the stack for later usage. REDO then continues by executing a "CPIR" instruction to search for the end of the line, as indicated by a zero byte. The start of the I/O buffer is then recovered off the stack and replaced with a pointer to the end of the line. The physical end of the I/O buffer is then determined by adding 255 to the start address. We then do a few manipulations to set up other pointers and length counters, and then execute a "LDDR" instruction to move the line stored in the I/O buffer up to the end of the I/O buffer. This allows the ROM "de-tokenisation" routine (at address 2B7E) to be called. This routine cannot perform "in-place" expansion of Basic keywords, hence the line to be expanded was moved to the top end of the I/O buffer, and expansion takes place into the bottom end.

The next thing to do is to set up the return address to be used when EDIT finishes. This return address is 1A81, a strategic point in the Basic interpreter which will cause the I/O buffer to be executed. This address is placed on the stack, followed closely by the line number to be used by EDIT. The line number specified is FFFF, or 65,535, which holds special significance for the level II EDIT routine and allows us to control what happens when the EDIT finishes. Lastly, we set up the HL register pair to point to the start of the I/O buffer and jump into a convenient place in the EDIT routine.

Because we specified a line number of 65,535, if you give the "L" edit command, EDIT will indicate that you are editing line number 65,535. In fact this is not the case, 65,535 is a special line number which cannot normally be generated, and which prevents EDIT from attempting to replace the line into program storage.

As stated before, the "A" edit command will not work when you are editing the last line. This is because "A" operates by re-retrieving the line being edited from program storage area, thereby removing any changes made to the copy in the I/O buffer. Since what we are editing did not come from the program storage area, we have nowhere from where to get a fresh

copy, and hence the "A" command will fail with an "undefined line number" error, when line 65,535 is not located.

### APC-80 BLUDNERS

In the last APC-80 article, "APC-80 Rides Again", a couple of errors sneaked past our proof-reader. The first of these is on page 66, second column in the third paragraph. The example should read:

```

"IF A > B THEN BEEP 30,30
ELSE BEEP 100,100
should be coded as
IF A > B THEN : BEEP 30,30
ELSE : BEEP 100,100"

```

The second error is in table 3, where the assembler directive "ORG" was printed as "OR6". I have been given a personal assurance that no more such errors will occur again.

### LISTING ONE

Basic modifications to upgrade to version six. Note that byte three in line 1710 is "EB" not "E8".

```

# CHECKOUT

# Micro BEE

by Ian Davies

*The Micro-Bee is the latest kit computer from Applied Technology and is probably the most powerful of all the low cost machines currently flooding the market. Selling for \$399, it comes with 16k of RAM, 16k of ROM, RS-232 interface, sound generator, lower case characters and high resolution graphics.*

The unit is about twice the size of a ZX81, and includes a real 60 key QWERTY keyboard — small but definitely manageable. The machine is Australian designed by Applied Technology, a name that for many years has been prominent in the field of kits, board level computery and components. It features a 2 MHz Z80 microprocessor and, for a change, a non-Microsoft ROM. The ROM claims it was 'written by Mathew Starr (1982) for MICROWORLD', and therefore shows some interesting deviations from the old Microsoft standards. I will not go into the kit aspects of the machine just yet, but start by looking at the machine as a machine, and seeing what it has to offer.

## Hardware/Software

The Micro-Bee uses an external twelve volt supply (provided) to cut down on size and safety regulations. The voltage regulators are on-board, and nothing seems to run too hot. The keyboard is angled very slightly backwards, and if you have much to do with keyboards, feels very odd the first time you lay hands on it. Much to my surprise, the feeling wore off very quickly and was never noticeable again. It seems it was just an initial shock in handling a keyboard that's not sloped five degrees forward (ZX80 owners won't notice a thing). The machine outputs a direct video black and white signal which can be fed into a monitor or a modified TV set. Alternatively, you can purchase a modulator and connect it straight into a normal TV. It would have been nice if

the unit came standard with an RF modulator. I ran it into a modified TV set, and the result was very pleasing. I would recommend the same method for most people, as a small Black and White TV is cheaper than a monitor and can still be used for normal viewing. The modification to allow direct video input is not difficult to do and generally produced a higher quality result than does a modulator.

The RS-232 interface can be read and written very easily in Basic programs at either 300 or 1200 baud. The cassette interface can also run at 300 or 1200 baud, although I would use the 300 baud option on most portable cassette players. The sound generator can produce 24 different tones with a duration variable in eighth second increments. It is not capable of fancy sound effects or violin concerto, but it is sufficient for playing tunes or producing simple noises in Basic programs.

The upper and lower case characters are very readable, but loose definition in 'inverse' mode. Lower case variables are considered to be the same as upper case variables of the same name, which is good, as I have used a machine where the variable 'A' is different from the variable 'a', and it can become an easy source of bugs. On this machine, if you give the statement 'a=7' and then 'PRINT A', the value 7 will appear. Unfortunately, variable names are fairly restricted. Numeric variables may be named by one alphabetic character, optionally followed by one numeric digit. This method is getting back to

the old Dartmouth standard, which is probably best forgotten. String variable names are even worse. These must be an alphabetic followed by a numeric followed by a dollar sign. In other words, 'A' is an illegal variable name, it must instead be 'AØ\$' or 'A1\$', etc.

The keyboard features auto-repeat when a key is held down. Basic programs can be terminated by pressing the BREAK key or by control C. Program output can be paused and re-started by use of control S and control Q, respectively. Now it gets interesting. The keyboard also contains a key labelled "REPT" which, if you have much to do with terminals, usually stands for REPEAT and appears on terminals which do not have the auto-repeat facility. Applied Technology says it stands for "REPROPT", a name created to correspond to the key label. In fact, it is a 'warm start' key which, when held down for about half a second, generates an interrupt and returns the machine to a "ready" state without destroying the program or variables. This seems like a very good idea, as most key pressing takes a lot less than half a second and therefore accidentally pushing the warm start button would usually have no effect. My only criticism is the name of the key, "REPT" is far too misleading — something like "RESET" would be better.

Holding the "ESC" and "REPT" keys down together will generate a cold start, which is equivalent to a power-up in that the program is removed and all variables are lost. The "ESC" key also

# HUGE SAVINGS

## CLEARANCE SALE of Computer Products and Surplus Stock!!

LOW PRICES for a wide range of computer peripheral equipment.  
The following items are listed with normal retail prices followed by our special  
LIQUIDATION price!!!

### PRINTER INTERFACES

ADA 1600 produces Centronics output from IEEE-488 — essential product for any Commodore computer owner!!

Normally \$234.00

**NOW \$160.00 only while stocks last!!**

ADA 1450 produces RS-232 C output from IEEE-488. Use for connecting serial devices such as terminals, acoustic modems, or serial printers to Commodore computers.

Normally \$258.00

**NOW \$199.00 — very limited stocks!!**

UCI Universal Commodore Interface — Produces Centronics parallel and RS-232 C and 20mA current loop output from IEEE-488 in BOTH directions. Use it for communicating between IEEE computers or program conversion etc. Can also be used to convert incoming serial transmissions to parallel form for a Centronics type printer etc. Truly a UNIVERSAL interface!

Normally \$468.82

**NOW \$325.00 — INCREDIBLE VALUE!!**

### DISK DRIVE UNITS — COMPLETE

• For TANDY Model I and III. We have both single and double disk drives at unbelievable prices! For instance a single MPI B-51 drive mechanism complete with power supply, external edge connector and attractive cabinet for an **unbelievable \$375.00.**

Normally \$499.00

**SAVE OVER \$120 OR 25%**

• For TANDY Model II Units. We have single, double and triple drive units from VISTA computer at prices too good to be true — except that these units are the same as used by leading NATIONAL ORGANISATIONS and government departments and come with an unconditional 90 day parts and labour guarantee with on-going maintenance for a mere 11% of capital cost per annum.

Single 8" drive —

Tandy's price \$1,999.00

**OUR PRICE ONLY \$1,050 per unit!!**

Double 8" drive —

Tandy's price \$2,999.00

**OUR LOW PRICE \$1,899.00**

**Never to be repeated and limited to current stocks only!**

Triple 8" drive — Our most popular unit with capacity up to 3.6MB using P&T CP/M 2.2e. Wait for the price — Tandy will slug you \$3,999.00 for a similar unit with 1.5MB capacity!

**OUR never to be repeated price — ONLY \$2,800.00— while stocks last!**

Send stamped, self-addressed envelope for a complete list of our other products.

# HUGE SAVINGS

## CLEARANCE SALE OF TANDY COMPUTERS

We have a strictly limited number of Model III TRS-80's which have been used for display purposes and are slightly shop soiled. They still carry our NEW warranty of 90 days parts and labour and are in perfect working order!! You could say that they've been fully tested as we are very fussy about the equipment we use to sell from. Normally these units sell for \$3,299.00.

**TO CLEAR THESE UNITS WE WILL KNOCK OFF \$500.00 TO THE FIRST 3 PEOPLE THROUGH THE DOOR CLUTCHING \$2,799.00!!**

If required we can offer an extended warranty on these units for the first 15 months for an extra \$307.00! (12 months + 90 days)

### VIC 20 PERSONAL COMPUTER

We are the largest retailer of VIC 20's in Adelaide and our volumes enable savings on both CPU's and peripherals from both Commodore and Stack Products in the UK. Included in our product range is a new 8 Channel Analogue to Digital converter with provision for up to 4K of EPROM on the one board. This unit can be used as a controller around the home for lighting, heating or general experimentation.

**WE WILL NOT BE BEATEN ON PRICE AND WE ARE NOW INCLUDING 3K OF ADDITIONAL PLUG-IN MEMORY WITH EVERY VIC 20 PURCHASE FOR \$419.00!**

**NORMALLY \$449 . . . . SAVE \$30**

Before you buy any VIC product do not hesitate to call us for a better price AND availability. We are Authorised Commodore dealers and offer the standard 90 day warranty plus full servicing facilities unlike most of our competitors. Personal shoppers should call at our Colour Computer Centre at **220 Morphett Street in Adelaide**, just 3 doors from the TANDY COMPUTER CENTRE.

### PRINTERS

We are the acknowledged printer people as we have specialised in printers now for almost 2 years. We handle the ITOH 8510 Graphics printer, the STAR printer plus the whole range of TANDY, COMMODORE and ANADEx Printers. We also handle daisywheels. If you have an interfacing problem we can help you there, too! We've connected Wangs, Hewlett Packards and other Mainframes to our printers and we can probably handle your problem, too. Please call for pricing and technical information.

220 MORPHETT STREET, ADELAIDE, S.A. 5000

TELEPHONE: (08) 211 8146

allows you to reposition the active area of the screen. Pressing "ESC" followed by "S" will transpose the screen one character position to the right. Similarly, "A", "W" and "Z" allow movement left, up and down, respectively. This is an interesting feature and, although the manual did not say so, is presumably used for correcting alignment differences between the computer and the TV.

Two graphics modes are provided. The first is low resolution graphics giving 128 by 48 pixels - the same as the TRS-80/System 80. The high resolution mode supplies 512 by 256 pixels. Both modes can be intermixed with character information on the normal 64 by 16 position grid. An additional graphics feature is "programmable characters", and it is here that the machine starts to fall down. The manual gives an example of user defined characters (little men and spaceships), but nowhere does it tell you how to define your own characters. It says that this topic is covered elsewhere - but the 'elsewhere' never turns up!

The character set consists of 128 permanent characters and 128 programmables. The high resolution graphics are generated (transparently to the user) by defining programmable characters and displaying them. A clever trick, but the fact that there is only room for 128 programmable characters means that sooner or later you are going to run out, and it is often sooner. I wrote a program which used the PLOT statement to draw a single border around the screen and then used

*MicroBee with cover removed.*

PLOT 1 to draw a line between a series of randomly chosen points. After five to ten random lines, the programmable characters were exhausted and the program terminated with an error. Although you can generate a reasonable amount of graphics before running out of space, the fact that the limitation was so easy to detect means that it must be considered as a serious short coming in the system. I was quite disappointed about finding the problem, as the machine was measuring up extremely well until this point.

Apart from the matter just mentioned, the graphics functions seem quite flexible. There are the usual SET, RESET and POINT functions which can be used in either high or low resolution

mode, with different allowable ranges, for example, SET (200, 200) is legal in high resolution mode, but not in low resolution. A PLOT statement is also provided for drawing lines between a series of points. It has four forms: the first of which simply draws a normal line, PLOT R resets the pixels along the line, PLOT I toggles the pixels and PLOT H is the same as PLOT except it inverts the vertical axis. It is not possible to combine options, e.g. PLOT RH, but this is not a serious restriction as it is unlikely that anyone would want to use the "H" option.

The screen is generated using a 6545 CRT controller chip, which explains why high resolution graphics rely on programmable characters. The 6545 allows a wide variety of video outputs, some of which are made available by the Micro Bee. Automatic underlining is provided, as are reverse video characters. Only one of these can be active at the same time, which is not due to the 6545, but to the way in which it is used. For the same reason, no automatic flashing or dual intensity is available. The 6545 does have an input for a light pen, but Applied Technology decided to adapt this logic to keyboard scanning thereby dropping the cost of the machine, but also preventing the 6545 from being interfaced to a light pen. Presumably a light pen could still be attached through some other interface, but it would not be as convenient as using the 6545 facility. The manual states that the 6545 can be programmed to allow other display formats (e.g. 80 x 24), but I suspect that a ROM change would also be required. The only other point of interest on the video side of things is the cursor. It is normally a flashing underline character and, since it is generated directly by the 6545, can very easily be turned off, made into a block of reverse video or be made to stop flashing. The backspace key is logically destructive and although this is common on many of the larger mainframes, is nevertheless confusing.

## Z80 PROGRAMMING

Call Geoff Lohrere for:

- System 80 repairs and modifications,
- Eprom copying,
- Eproms programmed with your own programs,
- Character generators programmed with character sets of your own choice,
- System 80 modified to output sound,
- Lower case kits for System 80.

Z80 Programming  
57A Stanley Avenue  
MT. WAVERLY, 3149  
ph. 543-1485

One of the most refreshing features the machine has to offer is parameters on subroutine calls. This means that subroutines can be called by GOSUB [A, 7.1, C9] 1000 the first line of the subroutine at 1000 would then be 1000 VAR (Z1, Z2, Z3) This has the effect of moving the values specified in the GOSUB into the variables listed in the VAR statement. The parameter variables are not local to the subroutine and hence results may be passed back through them. With features like this, it is a real pity that the variable names are so restricted.

User definable functions are also provided, however these are also a bit restricted. Only seven user definable functions may be used and they are identified by a single digit. They can also only have one parameter. For example: FN2 = SIN (#) / COS (#) The "\*" symbol is used to represent the parameter passed into the function. Although these restrictions do serve to limit the usefulness of the functions, it should be remembered that many machines do not provide them at all on their base models, and that parameters on subroutines more than make up for possible short comings in other areas.

Only two data types are available, these being string or single precision. There are no true integer or double precision modes, although the SD statement can be used to set the number of significant digits to use in calculations. One advantage of supporting single precision only is that it is possible to PEEK or POKE locations above 32,767 without using negative addresses required by most MICROSOFT Basics. To my mind this is a much more sensible way of POKEing.

The manual did not have much to say about strings, but I assumed that the usual limit of 255 characters would apply and ran a small program to test it, shown below:

```
10 STRS (1000)
20 A1$ = ""
30 A1$ = A1$ + "X"
40 N = N + 1
50 GOTO 30
```

The STRS statement is used to reserve string space, and I gave it lots of room just to be on the safe side. The program ran for a while, and then aborted, just as expected. The length of A1\$ was 254 - a bit surprising, but nothing to be amazed about. Further probing revealed that it had used up its 1000 bytes of string space and that N was equal to 766. Now that is incredible! I could find no rational explanation for these strange results — perhaps Applied Technology could shed some light on the matter.

The MICROWORLD Basic provides a string function called SEARCH, which is effectively the equivalent of INSTR in most other Basics, used for searching a string for sub-strings. A couple of string functions are noticeable by their

absence, namely LEFT\$, RIGHT\$ and MID\$; although it could be possible to implement these using PEEKs.

The Basic also supports some nice program maintenance features, such as a high quality RENUMber. An interesting command is the global search and replace, called GX, which allows you to search through the entire program changing all occurrences of a specified string to another string. For example, GX/FRED/HARRY/ would change all occurrences of FRED to HARRY. Each time it locates an occurrence of the first string, it lists the line containing it and marks the start of the string by a block of reverse video. The user may then push the full stop key to change the string, or any other key to advance to the next occurrence. It is a very nice idea, but I feel it would have been more powerful if it allowed you to leave out the second string and thereby do searching, and if it were possible to specify a range of line numbers. Unfortunately the GX function does not allow you to use strings which contain slashes ("/"), as this character is reserved to delimit the strings.

There is no PRINT USING statement, but it is possible to perform some basic formatting in a FORTRAN type style, for example, PRINT [15 X], [F9.2 Y] would print the value of X as an integer in five spaces, and Y in nine spaces with two decimals. There is also an exponential format (scientific notation), and a rather peculiar alpha format which might, conceivably, come in handy sometime.

One of the most sensible things I have seen for a long time is the MICRO BEE method of handling different I/O devices. Two statements are provided, IN and OUT, which are used for selecting the source of data for INPUT statements and the destination of output for PRINT statements, respectively. The statement keyword is followed by a numeric expression in the range zero to five, and optionally followed by "ON" or "OFF". In this way, I/O may be directed to different combinations of devices, with devices being selectively added or removed. The MICRO BEE still supports the old

PRINT/LPRINT pair, and a second parameter on the OUT statement means that these two streams of output can be treated separately and redirected to different devices. It is possible to direct printer output to the screen, but unfortunately it is not possible to do the reverse. This appeared to be the only lack of flexibility in their I/O system. Devices accessible include keyboard, VDU, printer, cassette at 300 baud, cassette at 1200 baud, RS-232 at 300 baud and RS-232 at 1200 baud.

The full repertoire of statements and functions are listed elsewhere in this article, but it is probably worthwhile going quickly over some of the more unusual of them.

## Assembly

The SPEED statement selects the display speed of the VDU. ZONE is a statement used to control the spacing of print zones on output, as used when elements in a PRINT statement are separated by commas rather than semicolons. PRMT allows the prompt character to be changed from the normal question mark to any character of the programmers choosing. The RESTORE statement has an extra option on it which allows restoration to a particular line of DATA statements. This is particularly handy, as it is quite common for a program to require one set of DATA for once only initialization, and another set which is repeatedly used during execution. The benchmark timings reveal nothing unexpected, except that the results of BM-8 are missing. The machine does have an exponential function ("^"), but it would not work in "LET" statements. It worked in PRINT statements, but as soon as I tried to store the result in a variable, the machine produced a diagnostic. The manual does not have a section on arithmetic expressions, so it is possible that there are some special rules. It is more likely, however, that it is the result of some bug in the interpreter. While this sounds like a fairly serious situation, it is a problem that is easily solved by Applied Technology or MICROWORLD. It's things like the limitations in high

MicroBee with clear cover.

## HIGH RESOLUTION, HIGH VISIBILITY GRAPHICS

MicroBee brings you unsurpassed graphics facilities under easy to learn BASIC control. In low resolution mode (128x48 units) you can generate 'chunky' graphics and run Tandy programmes. For finer control a couple of keystrokes, switch you to high resolution graphics (512x256 units) and still let you combine them with text. Doing all this is easy for MicroBee. It shares the same intelligent VDU controller IC with IBM's new personal computer. So, like the IBM, MicroBee has a fully programmable screen display. MicroBee's standard 16 line by 64 character upper/lower case format can be updated to the professional 80x24 format to run CP/M programs. No need for expensive add ons. Simple, easy to use BASIC commands make using your MicroBee easy, even if you're just getting into computers.

## UNIQUE CONTINUOUS MEMORY AND BUILT IN SOUND

Only MicroBee brings you this great facility. You can hold programs and data in continuous memory when you switch off, or move to a new location. There's no longer any need to store on cassette or floppy discs at the end of the day. A power failure doesn't mean the loss of valuable programs or data. An inbuilt battery holds everything in memory until power is restored or you switch on again. MicroBee, your portable terminal. MicroBee's built in sound facilities bring you two octaves of music to tune up your programming skills. Again under simple to use BASIC control. Add sound to your game programs. Or maybe write your own music. The speaker is inbuilt. And it's so easy to learn. MicroBee brings you unique facilities and opens up new programming opportunities. MicroBee, the personal computer that never forgets.

## SERIAL AND PARALLEL PORTS READY.

Your MicroBee is fully equipped to interface and communicate with the outside world. The programmable RS232 standard port means connecting a serial printer, modem or another computer is as simple as plugging it in. MicroBee's built in software means you're ready to run at 300 or 1200 baud. When you're ready to go further, use MicroBee's parallel port and connect up joysticks, Centronics type printers or any other peripherals needing a parallel port. Even the cassette interface has something special. It will store and load programmes at 300 or 1200 baud in either BASIC or Z80 code as well as letting you merge lines into an already existing BASIC program. MicroBee works happily with your ordinary audio cassette recorder, and gives you a good load and save every time, even at the higher (1200 baud) rate. It's as simple as plugging it in with MicroBee.

# *microbee does*

## EXPANSION POWER

If you're not sure how you'll be using your MicroBee in the future, we've thought of that too. MicroBee is designed for inexpensive future expansion. The basic MicroBee with 16K of user RAM easily converts to 32K with a changeover board. Adding ROM (Read Only Memory) up to 28K is as easy as plugging it in to the memory board. Want S100 expansion? MicroBee goes one better. Its unique Z80 expansion bus lets your MicroBee interface with S100 as well as all the other expansion buses.

And if you're thinking of using disc drives and want to be able to run world standard CP/M Software, MicroBee's still with you. The soon to be released memory board and factory mod convert your MicroBee to 48K RAM, running CP/M with the ability to take disc drives. So you can run the same programs as IBM, DEC, Xerox and HP do on their Micros. MicroBee, ready when you are.

## POWERFUL 16K MICROWORLD BASIC

Programming has never been simpler. Novice or experienced programmer, you'll find MicroBee's 16K BASIC in ROM a delight to use. MicroWorld gives you everything you get with other BASICs plus extra help. Like special error reporting and editing. And support of the built in sound and graphics facilities. So MicroBee's powers aren't hard to use. The BASIC also controls printers and modems. Writing programs is simpler because of the BASIC's search and replace ability. When you want to go further, **MicroWorld Editor/Assembler** helps you use Z80 code and write USR subroutines. It's in ROM for instant access. Or get going right away with **Cassette Programs**. From only \$6.95 each. Chose from games like Chase, Target, ZTrek, Solitaire, Wumpus, Biorythm, Calender Maker or utilities like Typing Drill, Diagnostic, Textmaster.

## SOFTWARE SUPPORT

As a MicroBee owner, you'll become a member of the MicroWorld Users' group, and receive our newsletter and updates. Your kit comes on 14 day satisfaction guarantee. And there's a \$50 complete cover service coupon if you have trouble.

You can phone order MicroBee on (02) 487 3798. Use your Bankcard. Or to Mail Order your MicroBee just write to: **MicroBee, Box 311, Hornsby NSW 2077** Due to enormous demand, MicroBee deliveries have been delayed.

**Complete kit**  
Includes 16K RAM,  
16K ROM BASIC,  
all manuals.

# \$399

Software includes:  
**Editor/Assembler (ROMs, Manual)** \$49.50  
**Cassette software** (each) \$6.95

## APPLIED TECHNOLOGY

Showroom/Office 1A Pattison Ave., Waitara  
Hours 9-5 Monday to Saturday.  
Phone (02) 487 2711 Telex APPTEC 72767

# microbee

# more, simply

resolution graphics that should be considered as serious, as this is a design fault which cannot easily be remedied.

The MICRO-BEE comes in kit form, and must be assembled by the owner before it can be used. It does not look too difficult to put together, but experience with soldering is essential. If you have never soldered before, it would not be a good idea to learn by putting together this kit. Preferably grab a friend who has soldering experience to help. Applied Technology separates the components into about half a dozen different containers to make identification easier. They also include resistor colour codes in the assembly instructions. The instructions seem clear, and are organised into a "tick the box" format. Everything you need is included in the kit (except a soldering iron, experience, etc.) including power supply, case, chassis, keyboard and IC sockets.

Applied Technology includes a "no apologies" coupon with each machine. If you get stuck at any point in the construction of the machine, send it to them along with the coupon and \$50.00 and they will complete the machine, test it for you and send it back. The manual stresses that if you are not too sure about something, use the "no apologies" coupon rather than risk ruining the kit. The coupon is invalid if you have caused too much damage to the machine. In general, the construction does not appear too difficult and I think that anyone with a reasonable amount of experience should have no trouble in getting it to work. I imagine that some people might be put off by the fact that the Micro-Bee is a kit, which is unfortunate as it is quite a machine. I would hope that Applied Technology brings out an assembled and tested version of the computer as they would probably find they would sell many more machines.

## Documentation

The documentation included with the machine is a construction manual, a Basic manual and a copy of the insert which recently featured in "Your Computer".

The assembly manual is excellent in all respects. The copy of the insert is vague and far from complete, at one moment trying to explain things in layman's terms, and at the next moment dropping in terms such as "classic Von Neumann architecture". The documentation seems confused about what the machine can do and contradicts itself concerning volatile memory. At one point it says the machine uses non-volatile CMOS RAM, and then later it says the memory is battery backed. I tried turning the computer off for 30 seconds and found that it is neither!

The Basic manual covers each statement, function and command in turn, but does not go so far as to cover such things as expressions, statement coding and layout rules, etc. The documentation is adequate as a first draught, but needs to be totally re-worked to bring it up to the quality other manufacturers are producing.

MicroBee with cover and coreboard removed.

## Expansion

Despite the one or two criticisms I made of the Micro-Bee, I must say that I was extremely impressed with it. There was more to review than I had expected, given its size and cost. Its biggest problem is the "assemble it yourself" aspect, as I am sure many potential buyers will shy away. Its other main problem is the competition offered by the low cost colour machines, but I think you will find that the Micro Bee offers more computing power for your dollar.

It's a good machine, it's Australian designed, and I definitely think that it is worth considering in your next micro-purchase.

## Conclusion

The machine is organised internally with all the memory on the one board. At the base model, this board contains 16k of RAM and 16k of ROM, with room for an additional 16k of RAM on the same board. The "core" board, as it is referred to, can be removed and replaced with a board containing 48k of RAM for running in a disk based CP/M environment. At the moment there is no news concerning disks, printers and light pens, but apparently an S-100 expansion interface is on its way, which should open the machine to a whole world of expansion.

The 16k upgrade is available in kit form for a cost of \$120.

## USER GROUPS INDEX

*Below is a list of alterations and additions to the list of user groups published in the March issue.*

**Perth '80 User Group.** Meetings are held at the Community Recreation Hall, Macdonald Street, Yokine on the first Tuesday of each month at 7.30pm. System 80 and TRS-80 users are welcome at meetings. For more information contact C. Powell (09) 457 6849.

**Ballarat Computer Users Group**  
Membership is \$5.00 per annum to cover postage of newsletter. Meetings on the first Thursday

of each month at the Hopetoun Street Community Education Centre in Ballarat. Interested persons can contact the Publicity Officer, John Preston, (053) 31 4363.

**Hewlett Packard User Group**  
Meetings are held as notified at 121 Wollongong Street, Fishwick. For more information, contact Claire Maguire (062) 80 4244 (BH).

**OMEGA – Ohio Scientific.** Meetings are held the third Wednesday of every second calendar month. Contact: Geoff Cohen (062) 49 2688 (BH).

**PET User Group.** Meetings are held every Saturday at Scott House, 219 London Circuit, Civic. More details are available from Greg Wilkins (062) 512 3836.

**Queensland Sorcerer Users Group (QSUG).** Meetings are held on the last Sunday of

each month at the Queensland University. Annual membership fee is \$10. For more information contact G. Snell (04) 205 1017.

**Northern Territory Micro Computer Users Group.** Meetings are held on the first Sunday of every month at 96 Freshwater Road, Jingili, Darwin. Further details may be obtained from the address above or write to H. Stockdale, 4 Bellara Street, RAAF Base, Darwin, 5789.

## NETWORK NEWS

*Here is a list of all Australian personal computer networks. As more networks appear – and as more facilities are added to existing ones – we'll report them in this section, which appears monthly.*

**The Australian Beginning.** Operator: The Australian Beginning Pty. Ltd. 364 La Trobe Street, Melbourne. Tel: (03) 329 7998. Facilities: Information service, electronic mail, software storage, and software downloading. Hours: 24 hours/day, 7 days/week.

**INFONET.** Operator: Network Services Division of Computer Sciences of Australia Pty. Ltd., 460 Pacific Highway, St Leonards, NSW. Tel: (02) 439 0033. Facilities: Access to

databases produced by the Australian Bureau of Statistics and the Institute of Economic and Social Research. Hours (E.S.T.): Monday to Friday (7am to 9pm), Saturday (8am to 5pm) and Sunday (8am to 11.30am).

**AUSINET.** Operator: ACI Computer Services, P.O. Box 42, Clayton, Victoria. Tel: (03) 544 8433. Facilities: Medium to databases whose subject coverage includes agriculture, education, energy,

industry, public affairs, science and technology and an online Australian database directory. Hours: 8.30am to 9.00pm E.S.T. Monday to Friday.

**CSIRONET.** Operator: CSIRO Division of Computing Research, P.O. Box 89, East Melbourne. Tel: (03) 419 1333. Facilities: Carries a broad range of scientific and technological databases compiled in Australia and overseas, including general scientific research, renewable energy resources, agriculture,

water resources, mining and geology, and thermodynamics.

**IP Sharp Associates Network.** Operator: IP Sharp Associates Pty. Ltd., 13th Floor, 175 Pitt Street, Sydney. Tel: (02) 232 6366. Facilities: The network is an international time sharing data processing network, the host computers being located in Toronto, Canada. Hours: 24 hours/day, 7 days/week.

# LET THE AUSTRALIAN BEGINNING

BRING MAINFRAME POWER INTO YOUR HOME OR OFFICE

## THE AUSTRALIAN BEGINNING PTY. LTD.

The Australian Beginning Pty. Ltd. is an Australian company, with Australian based computer facilities, using the Australian Telecommunications network to offer Australian clients Australian information services and software.

## WE ARE PROUD TO ANNOUNCE THE LAUNCHING OF AUSTRALIA'S FIRST MICROCOMPUTER INFORMATION UTILITY

*The AUSTRALIAN BEGINNING is Australia's first microcomputer information utility, aimed at giving the average microcomputer user access to the computer data banks and also massive storage space previously only available to large Mainframe installations. The era of home computers has now officially begun in Australia, now that the AUSTRALIAN BEGINNING is here: as now, any small businessman or student can have on his desk for an extremely small cost, a system that has the level of storage power and access to data banks for which only a few years ago, government departments and large private users were paying millions of dollars.*

*The AUSTRALIAN BEGINNING can be accessed through a number of 'approved' personal computers, and terminals, by use of an acoustic coupler or modem.*

*Users will receive a number of benefits which will include:*

### INFORMATION SERVICES

*Members will have access to a number of information sources which will include the latest news, sports results, financial reports, and farm information.*

### NATIONWIDE COMMUNICATION

*Members will be able, also, to communicate nationwide with other AUSTRALIAN BEGINNING members through our system.*

THE AUSTRALIAN BEGINNING  
RECOMMENDS 3M DISKETTES

### SOFTWARE BANK

*Users will have access to a myriad of computer programs that will include entertainment, educational aids, programming and diagnostic tools, and financial applications.*

### MAINFRAME POWER

*Users will have the capability to make use of the Mainframe's huge storage capacity by using any of our large programs, or storing your large programs on our system.*

### SHOP AT HOME

*You can take advantage of our 'shopping by computer' system to get the best prices on a number of popular consumer items.*

### EXTREMELY EASY TO USE

*You do not have to be a computer programmer to make use of the AUSTRALIAN BEGINNING. All of the instructions are in everyday English, so that even the younger members of your family will be able to operate the system.*

### LOW COST

*While services like these used to cost tens of thousands of dollars to the government departments and large corporations who used them, they are now available to you for less than the cost of a packet of cigarettes a day for the 'average' user.*

You can join the AUSTRALIAN BEGINNING by paying a one-time joining fee of \$100, and a small hourly user charge of \$10 an hour 8 a.m. - 6 p.m. and \$4.50 an hour 6 p.m. - 8 a.m. weekdays and all weekends.

TO JOIN THE AUSTRALIAN BEGINNING FAMILY, AND TAKE ADVANTAGE OF THE EXCITING SERVICES WE WILL BE OFFERING, PLEASE COMPLETE THE COUPON BELOW:

#### MEMBERSHIP REQUEST

*Yes, I think the idea of the AUSTRALIAN BEGINNING is great! I enclose \$100 so please send me my user manual and password.*

I have a computer, Brand.....

Model.....

Please send me information on low cost equipment packages I can use to take advantage of the AUSTRALIAN BEGINNING'S services.

I am interested, but I need more information.

DEALER INQUIRIES INVITED

# Programs

We are interested in programs for any of the popular micros – please specify which one you wrote your program on and how much it uses up. We'd also prefer more 'serious' software: games are all very absorbing, but the programme section of APC does seem rather one-sided. Make sure programs submitted are fully debugged before they're sent in, preferably on cassette with a clear listing enclosed. A short explanation of your program's function would also be desirable. If you want it returned, enclose an SAE and write your name and address on each piece of paper you send. Don't worry if you don't hear anything for a few months – programs take a long time to evaluate. And we pay for all programs we print. Send contributions to APC, 462 Burwood Road, Hawthorn, Vic. 3122.

Sincere thanks to everyone who has volunteered to join APC's referee scheme. Although we must now inform you that the number of volunteers is beginning to exceed demand and the register is closed to further applications. Those who have applied will be contacted with details of the scheme. And please keep sending in programs! Hopefully before too long, we'll be seeing more programs written for new machines such as the Ataris,

VIC-20, Peach and TRS-80 Color. You've read the tests, been to the shows, seen the adverts, now write the programs! There must be at least a few ardent keyboard bashers hiding one or another of the aforementioned under their TVs; there is a little evidence of this, but it's quite scarce. If you've having problems a carefully typed or, at last resort, hand-printed listing will be quite acceptable.

## TRS-80 Reaction Timing

By MG Green

The program measures the time taken to react to a cross appearing on a screen (signified by pressing a key) and then compiles a histogram after a specified number of tries and calculates the mean

and standard deviations which appear at the same time as the histogram. This one is in TRS-80/System 80 Basic and needs 14k.

```

Direct  
Computer  
Sales

 **apple**  
and  
**HARD DISK**  
Specialists

We offer real customer support

- \* as much help after the sale as before it,
- \* custom programming and configuring of Visicalc and data bases,
- \* staff training
- \* same day on site service,
- \* custom design of electronic equipment particularly the interfacing of micros to industrial equipment,
- \* financing to approved customers.

All this is possible because we have invested in staff who have the required skills.

Our products include:

- \* Apple II and III systems,
- \* Corvus Hard Disks,
- \* a full range of printers,
- \* software covering business, word processing, science and leisure.

Business Hours:

Mon, Tue, Wed, Fri:	9 – 6
Thur:	9 – 9
Sat:	9 – 2

Address:

# Can you afford to spend \$3.50?

More important, can you afford NOT to spend \$3.50 for this month's edition of Australian Business Computer.

If you are in business, you will find ABC is packed full of concise, valuable information to help you manage your computer resources more effectively.

If you are about to buy your first computer for business, ABC has timely advice. This month and every month, Australian Business Computer keeps you up to date in the world of business computing.

## IN THE NEXT ABC:

\* What size computer is best for you? \* Computers in retailing. \* Straight-forward advice from columnist Ashley Goldsworthy. **AND MUCH MORE**

## SUBSCRIPTION ORDER FORM

I would like to subscribe to Australian Business Computer for 1 year (10 issues)

- \$35 within Australia  Aust \$45 overseas surface  Aust \$100 overseas air  
 I enclose my cheque, payable to Australian Business Computer for \$  
 Please invoice my company  
 Please charge my Bankcard. Bankcard Number .....

Expiry Date.....Signature.....

Name.....

Address.....

## ZX81 Graphplot

by N Angell

This runs in 1k and will plot a graph for a large variety of equations of the form  $y=2x$ ;  $y=x^2+4$ ;  $y=1/x$  (y in terms of x). It requests the equation and then works out maximum values for x and y thereby dividing the screen appropriately. This done, it will plot the graph using the previously deduced

volumes as limits so that the graph does not run over the edge of the screen. It is useful for handling negative values in plotting graphs. The number or range of x values can easily be altered — see lines 110 and 120 — according to the equation used or the accuracy of plotting required.

```

## INSTANT ROM

Have you ever wanted to write programs that would stay in your COMMODORE permanently? Extend BASIC, write security programs, special print routines? And put them into an EPROM and plug them into your COMMODORE? (and some other popular micros)  
Now you can do it quickly and easily - and you don't need an EPROM programmer!

**INSTANT ROM FOR COMMODORE** INSTANT ROM is 2k, 4K or 8k of CMOS memory with battery back-up. Just plug it into the socket provided on your COMMODORE. Then write your program into it as if it were RAM. Or load programs into INSTANT ROM from tape, disc, or some other part of memory. Then remove the Write Enable lead, and your program is there, permanently - for years! Even when the power goes off! The computer automatically keeps the battery charged. You can debug it, add to it, alter it - instantly. You can change a single byte or even a single bit - no erasure problems. And you can copy other programs into it in seconds.

## Every PET needs a FRIEND...

Introducing a new series of programs that are 'FRIENDLY' to the user and represent outstanding value for money. . . .

and there will be more 'FRIENDS' coming

### FRIEND 1 - Word Processor

An on-line ROM chip for 8, 16, and 32K machines. This Word Processor program has been written by professionals specially for The Microcomputer House.

The program can be used with or without a printer and will be available shortly in disk and tape versions as well.

WP CHIP	\$85
DISK	\$70
TAPE	\$60

### FRIEND 2 - Mailing List

This is a dual disk based system for the 4000 series microcomputers. It caters for 2,100 records per data disk and offers sort and select facilities. It will also be available shortly for single disk systems.

MAILING LIST \$85

### FRIEND 3 - Data Handler

This is a ROM chip containing machine language routines which allow the programmer to control screen input. ●Alpha Field Entry ●Numeric Field Entry ●Date Entry ●Disk Fastget ●Field Reverse ●Field Flash. Each of these functions have different options. FRIEND 3 is a derivative of our security ROM used by all our packages. 4000 Series and 8000 Series only \$85.00 each.

All programs come with a complete instruction manual.

## G-Pascal \$35

Our new high-speed Pascal compiler  
implements a useful subset of Pascal  
for the standard Apple II.

### Features:

- \* Compiles at over 4,000 lines/minute.
- \* Only uses 12K for compiler, P-code  
interpreter and text editor.
- \* Extra memory or disks not needed.
- \* Very easy to use and user friendly.
- \* Comes with comprehensive manual.
- \* Demo programs with disk version.
- \* English error messages (not codes)  
with arrow to point of error.
- \* Once G-Pascal is loaded you can edit,  
compile and test continuously without  
needing any further disk or cassette  
access - makes debugging fast and easy.
- \* Data types: CONST, INTEGER, CHAR
- \* Integers from -8388608 to +8388607
- \* Single dimension arrays.
- \* PROCEDURE, FUNCTION, WHILE, REPEAT,  
FOR, IF, CASE, GOTO, peeking and  
pokeing, graphics, music and more!

Cassette: \$35 Disk: \$40 Manual only: \$5

## Graphics Dump

Dump your Apple II-res screens to the  
Datascout DS180 printer. Variable size,  
multiple copies, inverse or normal. \$20

## Life

Uses Apple hi-res graphics to display  
fates of shapes that you define. Displays  
AS, BS separate 'lives'. Start with  
simple boxes and lines and watch them  
'mutate' into incredible shapes. Cool in  
colour or black & white. Great fun! \$20

All written in machine code for Apple II  
>4K or more. Diskette or cassette (please  
specify). Mail order only. Send cheque to:

## Gambit Games

# Microline

SERIES OF  
DOT MATRIX PRINTERS

## Microline 80

ONLY \$495 + TAX (=\$565)

80 CPS UNIDIRECTIONAL 80 COLUMN

### STANDARD FEATURES

- 40, 80, 132 columns
- 6 and 8 lines per inch
- 200,000,000 character head life
- Centronics interface
- Graphics
- Continuous operation
- Plain paper - up to 3 parts
- Paper tear bar
- Friction and pin feed
- Upper and lower case

## Microline 82A\*

120 CPS BIDIRECTIONAL 80 COLUMN

### STANDARD FEATURES

- Centronics and RS232C interface
- Upper and lower case with true descenders
- 40, 80, 132 columns
- 6 and 8 lines per inch
- Rear/bottom paper path entry
- Graphics
- Plain paper - up to 4 parts
- Multi-national character sets
- Paper tear bar
- Friction and pin feed

## Microline 83A\*

120 CPS BIDIRECTIONAL 136 COLUMN

### STANDARD FEATURES

- Friction and tractor feed
- Centronics and RS232C interface
- Upper and lower case with true descenders
- 6 and 8 lines per inch
- Rear/bottom paper path entry
- Graphics
- Plain paper - up to 4 parts
- Paper tear bar
- Double width and condensed characters

THE BEST WORD PROCESSOR

**WORD PROCESSOR FOR THE APPLE II COMPUTER**

*Features include:*

- ★ A comprehensive word processing package with all the facilities one expects to find on a high priced word processor.
- ★ Full screen/cursor editing with unlimited bidirectional scroll.
- ★ Screen/cursor based insertion, deletion, search, search and replace, and block move. You simply move the cursor to any place in the file and insert or delete the required text.
- ★ Carriage returns may be included anywhere in search and replace strings, inserted or deleted like any other character.
- ★ Embedded print commands permit one to vary indent, left margin and so forth within the text.
- ★ Automatic disk backup permits very large files to be handled.
- ★ The user can define his own mailing list fields and can select on any or all of the fields.
- ★ Edits programs.
- ★ Two display modes: Edit mode (the one normally used) which shows the text exactly as is, folder over to fit in the 40 column screen and test print mode that shows the left and right edges of the text as it will look when printed.
- ★ Hardware requirements: 48K Apple II with disk drive and ROM Applesoft basic. The 16 sector version will operate with the language card instead of ROM Applesoft.
- ★ Excellent after sales services and updates.
- ★ Recommended Retail Price **\$195.00.**

Available at Selected Apple dealers.  
Dealers can enquire by telephone  
**(02) 630 3807**

OR send cheque, money order,  
bankcard authority etc. etc. to

 **epsilon** is so good that we guarantee to refund your money within 14 days if you're not satisfied with it.

# COMPETITION RESULTS

Although it appears unlikely that most of Australia's writing ability, in the field of microcomputing, would come from North Adelaide, certainly two of the best three articles submitted in the APC printer competition came from this suburb.

Congratulations to Bruce Duncan (who wrote on the application of computers in analysing genetic trees), Mark Little (binary tree manipulation and decimal arithmetic on the Z80) and Russell Thamm (who wrote an editor for the Apple II), who will each receive a computer printer. A further twenty entrants have received a year's subscription to APC for their excellent articles.

APC would like to thank all readers who submitted entries to the Printer Competition.

## PRINTER WINNERS:

Bruce Duncan, North Adelaide  
Mark Little, Wynnum North  
Russell Thamm, North Adelaide

## 20 SUBSCRIPTION WINNERS:

J. Boatwood, Sydney  
I. Champ, Launceston  
W. Crandall Jr, Double Bay  
D. Dowling, Morrisons RMD  
M. Garland, Taree  
I. Gronovski, Rose Bay  
J. Hyde, North Epping  
R. Maneschi, Cremorne Point  
J. Pearce, Rosanna  
B. Rogers, Asquith  
W. Russell, Croydon  
J. Schultz, Nedlands  
E. Sike, Sydney - Narwee  
S. Smith, Caringbah  
J. Stevenson, Sheffield  
P. Taylor, Auckland  
D. Thorpe, Glenunga  
L. Wong, Botany  
R. Worley, Glen Waverley  
S. Zadarnowski, Kwinana Beach

## Free Brochure tells you how to save work finding, comparing, selecting Semiconductors ICs, Microprocessor Software

Send now to see how D.A.T.A.BOOKS can help you make device and software comparisons by studying just one page of essential technical information on dozens of similar devices (or programs), by seeing device drawings at the flip of a page . . . by finding devices even if you have only a function in mind . . . or software if you are working with a specific microprocessor.

Free brochure fully describes these 23 D.A.T.A.BOOKS:

- Microprocessor ICs
- Microcomputer Systems
- Microprocessor Software
- Consumer ICs
- Digital ICs
- Linear ICs
- Interface ICs
- Memory ICs
- Discontinued ICs
- Power Semiconductors
- Optoelectronics
- Discontinued Optoelectronics
- Microwave
- Discontinued Microwave
- Transistor
- Discontinued Transistor
- Diode
- Discontinued Diode
- Thyristor
- Discontinued Thyristor
- Master Type Locator
- Discontinued Type Locator
- Application Notes Reference

## LOOKING FOR FINE PRINT ?

ASP specializes in fine print. Conversions for the IBM, Olivetti and Olympia ranges of typewriters, high speed low cost Daisywheel printers (\$2,200) and high quality matrix printers. Take the excellent range of IBM typewriters. Typewriters with superb keyboard feel and robust construction. With ASP Interfaces ALL models can be used as computer printers. Selectric Models I, II and III (\$740). Electronic Models 50 and 60 (\$525) and Electronic Model 75 (\$575). The Selectric Interface includes a precision electro-mechanical assembly that fits inside the typewriter. Detailed user installation instructions are included, or you can use ASP's fast installation service (\$100). Models 50, 60 and 75 are fully electronic, so installation is simpler. Special connectors plug into the IBM electronics. The same electronic assembly controls all models. Enclosed in a compact case with controls for power on/off, hold/run/self test, it uses microprocessor design for reliability and best performance from the typewriter. Computer data can be accepted either RS232 or Parallel, so all computers are catered for. ASP will make custom cables to suit your system at moderate cost. All Interfaces are "print only", and use as a typewriter is unaffected. Your computer can even use the special features of the Electronic Models.

## OLIVETTI TYPEWRITERS

And now our IBM Interface, reprogrammed, will operate the Olivetti Daisywheel typewriter range. Just like with the IBM Electronics, our microprocessor monitors typewriter performance to ensure maximum throughput. Price again is \$525.

Whatever your fine print requirements ASP can help.

## STORING A LOT IN A SMALL SPACE

By now you've heard of our STRINGY FLOPPY. Fitting up to 75K of data on a Wafer the size of a credit card. A low cost disk alternative. TRS-80 Model I (\$399), Sorcerer (\$433), RS232 MicroSponge (\$478), Stringy Bare (\$199), and soon TRS-80 Model III. And all come with documentation, supply of Wafers, and extra software. But perhaps you haven't thought of some of the interesting applications available. Data Base Managers, Word Processing Programs, Editor/Assemblers, DOS-like operating systems, and now even a version of VisiCalc. Team a TRS-80 Stringy Floppy with our Internal Memory (48K in keyboard for as little as \$152) and the Model I becomes a useful business tool. Enquire about our suggested Stringy Floppy business and word processing configurations, and our money saving package deals including computer.

For those who have persevered through the fine print, some new products. Our communication soft/hardware package will soon be released for disk and Stringy Floppy Tandy computers. Our stand alone WhisperStore word processing, data entry system for connection to Olympia typewriters is available.

# Don't wait for Telecom

COMMUNICATE TODAY WITH AN ACOUSTIC MODEM

At The Logic Shop we will show you how you can communicate using a Sendata Acoustic Modem, for as little as \$299\*. Starting Today! Sendata Acoustic Modems are fully approved by Telecom and allow you to communicate with public data bases, time sharing networks, and other organizations and individuals. Acoustic Modems enable you to access large computer power and also "talk" to other computer users via the normal dial-up telephone network. Sendata Modems suit most RS 232 compatible computers and terminals.

The Logic Shop carries the full range of Sendata Acoustic Modems in stock including: 300 BPS to 1200 BPS, full duplex and half duplex models.

If you would like advice on which Sendata model suits your particular needs, please give us a call and our trained staff will be happy to assist you.

BOX 672, G.P.O., SYDNEY, 2000, TELEPHONE (02) 238-9984

As the February issue's "Lazing Around" went walkabout, I don't have any results to publish in this, the April, issue of APC. I am assured by the Editor such an horrendous blunder will not occur again (and ten strokes if it does).

### PRIZE PUZZLE

Using the ten digits 0 - 9, construct

Francis's language translator is strictly for the birds.

two numbers such that the first is the cube and the second is the fourth power of the same number, x. What is the value of x?

Answers on postcards, please to: Lazing Around, APC, 462 Burwood Road, Hawthorn, 3122 to arrive no later than May 30, 1982.

### QUICKIE

No answers, no prizes. Three boys have 20 nuts between them, Billy has 3 more nuts than Alan but five fewer than Charlie. How many nuts do they each have?

# HAVE WE ATARI SOFTWARE?

- Huge selection - Ask for latest listing.

We now not only have 250+ items for Atari but also one of the best selections of Apple II & Apple III Software and Hardware in Australia

# SORCERER SOFTWARE ASTRO ATTACKER

ASTRO ATTACKER - This is similar to the arcade game called "ASTRO BLASTER". This action game for the Sorcerer is far superior to all other Sorcerer games because of its high resolution graphics, sound, variety and playability. Astro Fighter's graphics are extremely advanced. The display is of the console inside your astro fighter craft. In your console window you see the enemy ships placed against a background of continuously moving stars. Gauges also indicate the amount of fuel remaining and the temperature of your lazer cannons. If you fire too frequently you can overheat the lazars, or if you move recklessly you may run out of fuel.

Your challenge is to survive and destroy the Spinners, the Lazer Ships, the Rockets, the Flame Throwers, and the Meteor shower. Docking with the mother ship is crucial to survival as this restores your shield strength and fuel, and cools your lazer cannon. With each succeeding level of play, survival becomes more difficult as the enemy ships attack with greater frequency and quickness. \$21.95

These programs and more available from:

Customized Technology, P.O. Box 461, Ashfield, NSW, 2131. Phone (02) 799 6373

Also available from: City Personal Computers, Electronic Agencies and other outlets. Ask for free catalogue.

# INTECOLOR DESKTOP COMPUTERS

The Professional Standards in colour computers  
and software available for your personal use.

## UTILITIES:

Screen Editor for BASIC, Macro Assembler, Text Editor, MLDP (Debugging did)

PLUS a wealth of scientific, educational, engineering and accounting software all entranced by colour graphics.

## FEATURES:

Now you can have a low-cost (systems for less than \$4,000) Intecolor Desktop Computer with displays of up to 64 colour combinations.

- All-in-one construction in stylised cabinet.
- 13"/19" CRT (No separate monitor).
- 72 or 117 professional keyboard.
- Upper and lower case (with descenders).
- MICROSOFT BASIC in PROM (standard) or optionally FORTRAN on DISK.
- FILE CONTROL SYSTEM in PROM.
- 2 standard character sizes, additional two under program control.
- RS232 port with programmable baud rate.
- Buffered parallel port.
- Internal 5¼" disk drive as standard.
- Your choice of external 8" drives or a 5¼"
- 5 Mb. Winchester.
- COMPUCOLOR Compatibility.

## APPLICATIONS SOFTWARE:

COLORCALC (column calculator), COLORGRAPH, EXECUGRAPH (business graphics), COMPUWRITER (colour word processor), CATS-80 system (Computer Aided Teaching System with colour graphics, voice synthesiser, deaf sign language). Accounts Payable, Accounts Receivable, AMWAY Program Series, General Ledger, Inventory, Statistics Packages.

# SX Is a Two Letter Word...

...describing the price performance leaders in table top computers.

Owning an SX from IMS International is a joy no matter which model you choose.

Both give you Winchester performance and a lot more.

Our 5000 SX table top computer features either a 5.5 or 11 MByte Winchester subsystem, plus one or two 5 1/4" floppy drives.

And our 8000 SX offers a 10, 20 or 40 megabyte Winchester, plus one or two 8" floppies, and a 17 megabyte

incremental cartridge tape drive subsystem.

Both high performance Winchester subsystems deliver awesome speed — ten times faster than floppies, on the average. You can load a 20 KByte system program in less than a second.

More importantly, IMS systems are engineered for reliability, so downtime won't take away the gains Winchester technology brings. They're strictly business, from their metal-not-plastic cabinets to their test-don't-guess circuitry.

And with our full 2-year warranty, you have it in writing.

Software for the SXs includes either single user, or our new high performance multiuser/multiprocessor operating systems, plus BASIC, FORTRAN and COBOL languages, and a host of compatibility-tested application programs.

For complete information and specifications on the 5000 SX and 8000 SX, along with the location of your nearby IMS International dealer, just contact us.

We'll tell you everything you ever wanted to know about SX.

# Commodore VIC-20

The Computer for everyone.

Just  
\$399

## Why buy just a video game when you can get a full colour computer for this price.

A computer like this would have been fiction a few years ago. Now it's a reality. It's the new Commodore VIC-20, a full-fledged, expandable colour computer that costs little more than the video games.

Everybody loves video games and the VIC-20 has some of the best. But the Commodore VIC-20 can also help the kids with their homework and mum with her home budgeting. Dad can even take the light, portable VIC-20 to the office for financial and business applications. And Commodore has many more applications on the way. With full capability for:

- Education programmes
- Recreational programmes
- Personal computing
- Includes Microsoft, PET BASIC
- Connects to any TV set
- 4 sound generators ● 16 colours
- 66 graphic characters
- Full-size typewriter-style keyboard
- Easy-to-follow instruction manual
- 25K total memory ● 5K RAM
- Memory expansion to 32K RAM

The VIC-20 is the friendliest way we know to learn computing. It has a full computer keyboard even a small child can operate. It plays music, has exciting graphics and lets you create pictures. It even tells you when you've made a mistake and how to correct it. The VIC-20 can take your children from pre-school through post-graduate studies.

Why get just another game that could end up in the closet? Get an honest-to-goodness computer for just \$399. Get the Commodore VIC-20.

So much brain for so little.

Commodore  
COMPUTER
